

SYSMAC CQM1/CPM1/CPM1A/SRM1 Programmable Controllers

PROGRAMMING MANUAL

OMRON

CQM1/CPM1/CPM1A/SRM1 Programmable Controllers

Programming Manual

Revised December 2005

Notice:

OMRON products are manufactured for use according to proper procedures by a qualified operator and only for the purposes described in this manual.

The following conventions are used to indicate and classify precautions in this manual. Always heed the information provided with them. Failure to heed precautions can result in injury to people or damage to property.

- **DANGER** Indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.
- **WARNING** Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.
- **Caution** Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury, or property damage.

OMRON Product References

All OMRON products are capitalized in this manual. The word "Unit" is also capitalized when it refers to an OMRON product, regardless of whether or not it appears in the proper name of the product.

The abbreviation "Ch," which appears in some displays and on some OMRON products, often means "word" and is abbreviated "Wd" in documentation in this sense.

The abbreviation "PC" means Programmable Controller and is not used as an abbreviation for anything else.

Visual Aids

The following headings appear in the left column of the manual to help you locate different types of information.

- **Note** Indicates information of particular interest for efficient and convenient operation of the product.
- 1,2,3... 1. Indicates lists of one sort or another, such as procedures, checklists, etc.

About this Manual:

This manual describes programming of the CQM1, CPM1, CPM1A, and SRM1 Programmable Controllers, including memory structure, memory contents, ladder-diagram instructions, etc., and includes the sections described below. Refer to the *CQM1 Operation Manual, CPM1 Operation Manual, CPM1A Operation Manual, and SRM1 Master Control Units Operation Manual* for hardware information and Programming Console operating procedures. Refer to the *SSS Operation Manual: C-series PCs* for SSS operating procedures.

Note The SRM1 is a specialized programmable controller and is normally called a CompoBus/S Master Control Unit. The SRM1, however, is programmed in the same way as the other Programmable Controllers and it is treated and referred to as a PC in this manual.

Please read this manual carefully and be sure you understand the information provided before attempting to program and operate the CQM1, CPM1, CPM1A or SRM1.

Section 1 explains the PC Setup and related PC functions, including interrupt processing and communications. The PC Setup can be used to control the operating parameters of the PC.

Section 2 provides an introduction to new PC features, including the new instructions available through expansion instructions and a new monitoring feature call differential monitoring.

Section 3 describes the structure of the PC's memory areas, and explains how to use them. It also describes Memory Cassette operations used to transfer data between the CQM1 and a Memory Cassette.

Section 4 explains the basic steps and concepts involved in writing a basic ladder diagram program. It introduces the instructions that are used to build the basic structure of the ladder diagram and control its execution.

Section 5 individually describes the ladder-diagram programming instructions that can be used with the PC.

Section 6 explains the methods and procedures for using host link commands, which can be used for host link communications via the PC ports.

Section 7 explains the internal processing of the PCs, and the time required for processing and execution. Refer to this section to gain an understanding of the precise timing of PC operation.

Section 8 describes how to diagnose and correct the hardware and software errors that can occur during PC operation.

The following appendices are also provided: A **Programming Instructions**, **B Error and Arithmetic** Flag Operation, C Memory Areas, D Using the Clock Function, E I/O Assignment Sheet, F Program Coding Sheet, G List of FAL Numbers, H Extended ASCII, and I CPM1A and CPM1 Memory Area Comparison.

WARNING Failure to read and understand the information provided in this manual may result in personal injury or death, damage to the product, or product failure. Please read each section in its entirety and be sure you understand the information provided in the section and related sections before attempting any of the procedures or operations given.

PRECAUTIONS

This section provides general precautions for using the Programmable Controller (PC) and related devices.

The information contained in this section is important for the safe and reliable application of the Programmable Controller. You must read this section and understand the information contained before attempting to set up or operate a PC system.

1	Intended Audience	xiv
2	General Precautions	xiv
3	Safety Precautions	xiv
4	Operating Environment Precautions	XV
5	Application Precautions	xvi
6	Conformance to EC Directives	xix

1 Intended Audience

This manual is intended for the following personnel, who must also have knowledge of electrical systems (an electrical engineer or the equivalent).

1

- Personnel in charge of installing FA systems.
- Personnel in charge of designing FA systems.
- Personnel in charge of managing FA systems and facilities.

2 General Precautions

The user must operate the product according to the performance specifications described in the operation manuals.

Before using the product under conditions which are not described in the manual or applying the product to nuclear control systems, railroad systems, aviation systems, vehicles, combustion systems, medical equipment, amusement machines, safety equipment, and other systems, machines, and equipment that may have a serious influence on lives and property if used improperly, consult your OMRON representative.

Make sure that the ratings and performance characteristics of the product are sufficient for the systems, machines, and equipment, and be sure to provide the systems, machines, and equipment with double safety mechanisms.

This manual provides information for programming and operating the Unit. Be sure to read this manual before attempting to use the Unit and keep this manual close at hand for reference during operation.

WARNING It is extremely important that a PC and all PC Units be used for the specified purpose and under the specified conditions, especially in applications that can directly or indirectly affect human life. You must consult with your OMRON representative before applying a PC System to the above-mentioned applications.

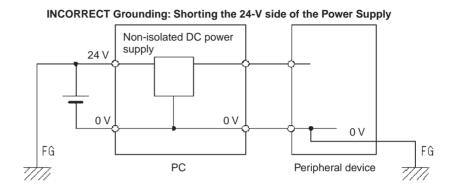

3 Safety Precautions

WARNING Do not attempt to take any Unit apart while the power is being supplied. Doing so may result in electric shock.

- **WARNING** Do not touch any of the terminals while the power is being supplied. Doing so may result in electric shock.
- WARNING Do not attempt to disassemble, repair, or modify any Units. Any attempt to do so may result in malfunction, fire, or electric shock.
 - Caution Tighten the screws on the terminal block of the AC Power Supply Unit to the torque specified in the manual. Loose screws may result in burning or mal-function.
 - Caution Execute online edit only after confirming that no adverse effects will be caused by extending the cycle time. Otherwise, the input signals may not be readable.

xiv

- Caution Confirm safety at the destination node before transferring a program to another node or changing the I/O memory area. Doing either of these without confirming safety may result in injury.
- Caution When connecting the PC to a personal computer or other peripheral device, either ground the 0-V side of the PC or do not ground the PC at all. Although some grounding methods short the 24-V side, as shown in the following diagram, never do so with the PC.

4 **Operating Environment Precautions**

Caution Do not operate the control system in the following locations:

- Locations subject to direct sunlight.
- Locations subject to temperatures or humidity outside the range specified in the specifications.
- Locations subject to condensation as the result of severe changes in temperature.
- Locations subject to corrosive or flammable gases.
- Locations subject to dust (especially iron dust) or salts.
- Locations subject to exposure to water, oil, or chemicals.
- Locations subject to shock or vibration.

Caution Take appropriate and sufficient countermeasures when installing systems in the following locations:

- · Locations subject to static electricity or other forms of noise.
- Locations subject to strong electromagnetic fields.
- · Locations subject to possible exposure to radioactivity.
- Locations close to power supplies.
- (!) Caution The operating environment of the PC System can have a large effect on the longevity and reliability of the system. Improper operating environments can lead to malfunction, failure, and other unforeseeable problems with the PC System. Be sure that the operating environment is within the specified conditions at installation and remains within the specified conditions during the life of the system.

5 Application Precautions

Observe the following precautions when using the PC System.

WARNING Always heed these precautions. Failure to abide by the following precautions could lead to serious or possibly fatal injury.

- Always ground the system to 100 Ω or less when installing the Units. Not connecting to a ground of 100 Ω or less may result in electric shock.
- Always turn OFF the power supply to the PC before attempting any of the following. Not turning OFF the power supply may result in malfunction or electric shock.
 - Mounting or dismounting Power Supply Units, I/O Units, CPU Units, Memory Cassettes, or any other Units.
 - · Assembling the Units.
 - Setting DIP switches or rotary switches.
 - Connecting or wiring the cables.
 - Connecting or disconnecting the connectors.
- Caution Failure to abide by the following precautions could lead to faulty operation of the PC or the system, or could damage the PC or PC Units. Always heed these precautions.
 - Fail-safe measures must be taken by the customer to ensure safety in the event of incorrect, missing, or abnormal signals caused by broken signal lines, momentary power interruptions, or other causes.
 - Interlock circuits, limit circuits, and similar safety measures in external circuits (i.e., not in the Programmable Controller) must be provided by the customer.
 - Always use the power supply voltage specified in the manual. An incorrect voltage may result in malfunction or burning.
 - Take appropriate measures to ensure that the specified power with the rated voltage and frequency is supplied. Be particularly careful in places where the power supply is unstable. An incorrect power supply may result in malfunction.
 - Install external breakers and take other safety measures against short-circuiting in external wiring. Insufficient safety measures against short-circuiting may result in burning.
 - Do not apply voltages to the Input Units in excess of the rated input voltage. Excess voltages may result in burning.
 - Do not apply voltages or connect loads to the Output Units in excess of the maximum switching capacity. Excess voltage or loads may result in burning.
 - Disconnect the functional ground terminal when performing withstand voltage tests. Not disconnecting the functional ground terminal may result in burning.
 - Install and wire the Unit properly as specified in the manual. Improper installation of the Unit may result in malfunction.
 - Be sure that all the mounting screws, terminal screws, and cable connector screws are tightened to the torque specified in the relevant manuals. Incorrect tightening torque may result in malfunction.

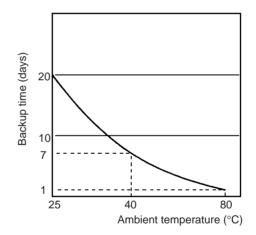

5

- Remove the label after the completion of wiring to ensure proper heat dissipation. Leaving the label attached may result in malfunction.
- Use crimp terminals for wiring. Do not connect bare stranded wires directly to terminals. Connection of bare stranded wires may result in burning.
- Double-check all the wiring before turning ON the power supply. Incorrect wiring may result in burning.
- Mount the Unit only after checking the terminal block completely.
- Be sure that the terminal blocks, Memory Units, expansion cables, and other items with locking devices are properly locked into place. Improper locking may result in malfunction.
- Check the user program for proper execution before actually running it on the Unit. Not checking the program may result in an unexpected operation.
- Confirm that no adverse effect will occur in the system before attempting any of the following. Not doing so may result in an unexpected operation.
 - Changing the operating mode of the PC.
 - Force-setting/force-resetting any bit in memory.
 - Changing the present value of any word or any set value in memory.
- Resume operation only after transferring to the new CPU Unit the contents of the DM and HR Areas required for resuming operation. Not doing so may result in an unexpected operation.
- Do not place objects on top of the cables. Doing so may break the cables.
- Before touching the Unit, be sure to first touch a grounded metallic object in order to discharge any static built-up. Not doing so may result in malfunction or damage.
- Do not touch the Expansion I/O Unit Connecting Cable while the power is being supplied in order to prevent any malfunction due to static electricity.
- When replacing parts, be sure to confirm that the rating of a new part is correct. Not doing so may result in malfunction or burning.
- ▲ Caution Always clear memory before beginning to program the CPM1, CPM1A or SRM1. Although memory is cleared before the CPU Unit is shipped (except for bits with specific functions), AR 1314, which turns ON when the internal capacitor cannot back up memory, may have turned ON during shipment.
- ▲ Caution If the CPM1 or CPM1A will be turned OFF for periods exceeding the data backup period of the internal capacitor, design the system so that it will not be influenced if data in the DM, HR, and CNT areas is cleared when power is turned OFF.
- ▲ Caution Either switch the CPM1 or CPM1A to RUN or MONITOR mode, or turn OFF and ON power to the CPM1 or CPM1A after changing from a Programming Device any data that is backed up in flash memory. This data includes the user program, read-only DM area (DM 6144 to DM 6599), and the PC Setup (DM 6600 to DM 6655).

 The user program and memory area data in the CPM1 or CPM1A are backed up either by an internal capacitor or in flash memory as shown in the following table.

Backup method	Data
Internal capacitor	Read/write DM area (DM 0000 to DM 0999, DM 1022, and DM 1023)
	Error log area (DM 1000 to DM 1021)
	HR area (HR 00 to HR 19)
	Counter area (CNT 000 to CNT 127)
Flash memory	User program
	Read-only DM area (DM 6144 to DM 6599)
	PC Setup (DM 6600 to DM 6655)

- The IR, TR, LR, and timer areas are not normally backed up when power is turned OFF and all contents will be cleared the next time power is turned ON. (The PC Setup setting in DM 6601 can be used to back up this data. Refer to details on the PC Setup later in this manual for details.)
 - 2. The bits in the AR and SR areas have special functions and are set according to these functions when power is turned ON.
 - The capacitor backup time depends on the ambient temperature, as shown in the following graph. The backup time, however, assumes that the capacitor is fully charged, which requires that power be supplied to the CPU Unit continuously for at least 15 minutes.

If the power remains OFF for a period exceeding the data backup period, AR 1314 will turn ON to indicate that the capacitor can no longer back up data and the data backed up by the capacitor will be cleared. AR 1314 will remain ON unless it is turned OFF using I/O monitor operations, using memory clear operations, or from the user program.

If desired, the PC Setup setting in DM 6604 can be set to create a fatal error and thus stop the system when AR 1314 goes ON.

- The data stored in flash memory will not be lost even if power remains OFF for a period exceeding the data backup period, because the data stored in flash memory will be read to the CPU Unit when the CPM1 or CPM1A is turned ON.
- If the power is turned OFF without changing the mode from PROGRAM mode to RUN or MONITOR mode after having made changes in the data that is backed up in flash memory, the changes will not be written to flash memory. If the power is then left OFF for more than 20 days (at 25°C), the

changes (i.e., the contents of the RAM) will be erased and the data values will become undefined.

▲ Caution Be sure that the SRM1 system is not influenced by any undefined data if the data in the DM, HR, or CNT area is cleared when the SRM1 has been turned OFF for a period exceeding the data backup period of the internal lithium battery. If the AR 1414 flag is ON, the data will be held unless it is turned OFF using the I/O Monitor operation, instructions, etc. The system can be stopped by designating DM 6604 in the PC Setup so that a memory error occurs when the power interruption hold area is not held (with AR 1314 ON)

• A lithium battery in the CPU Unit is used to back up the counter values and the contents of the DM area, and HR area. The deterioration of the lithium battery capacity depends on the ambient temperature. The standard service life is 12 years at an ambient temperature of 40°C when operating 8 hours a day.

If the power remains off for a period exceeding the data backup period, the contents of the Data Memory (DM), Hold Relay (HR), and Counter (CNT) Areas in the CPU Unit may be cleared and the AR 1314 flag (which turns ON when the power interruption hold area is not held) may turn ON.

If the contents of the CPU Unit's program area are lost, the program stored in flash memory will be read to the CPU Unit's program area when the SRM1 is started up because the contents in the read-only area (DM 6144 through DM 6599) and PC Setup (DM 6600 through DM 6655) will be written to flash memory.

 However, if the power is turned OFF without changing the mode even if changes are made in the read-only DM area (DM 6144 through DM 6599), or PC Setup (DM 6600 through DM 6655) using a peripheral device, the contents of changes will not be written to flash memory. Although the data in these areas is backed up by the lithium battery, contents of changes will disappear if the service life of the lithium battery expires. In this case, programs in the flash memory will be automatically read into the user program memory.

The changes can be saved by switching the SRM1 to RUN or MONITOR mode or turning OFF and restarting the SRM1 soon after the changes are made.

6 Conformance to EC Directives

The CQM1 PCs comply with EC Directives. To ensure that the machine or device in which a CQM1 PC is used complies with EC Directives, the PC must be installed as follows:

- *1,2,3...* 1. The PC must be installed within a control panel.
 - 2. Reinforced insulation or double insulation must be used for the DC power supplies used for the communications and I/O power supplies.
 - PCs complying with EC Directives also conform to the Common Emission Standard (EN50081-2). When a PC is built into a machine, however, noise can be generated by switching devices using relay outputs and cause the overall machine to fail to meet the Standard. If this occurs, surge killers must be connected or other measures taken external to the PC.

The following methods represent typical methods for reducing noise, and may not be sufficient in all cases. Required countermeasures will vary de-

pending on the devices connected to the control panel, wiring, the configuration of the system, and other conditions.

Determining if Countermeasures Are Required

Refer to EN50081-2 for more details.

Countermeasures are not required if the frequency of load switching for the whole system including the PC is less than 5 times per minute.

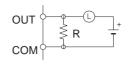

Countermeasures are required if the frequency of load switching for the whole system including the PC is more than 5 times per minute.

Countermeasure Examples

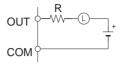

When switching an inductive load, connect an surge protector, diodes, etc., in parallel with the load or contact as shown below.

Circuit	Cur	rent	Characteristic	Required element
	AC	DC		
CR method	Yes	Yes	If the load is a relay or solenoid, there is a time lag between the moment the circuit is opened and the moment the load is reset. If the supply voltage is 24 or 48 V, insert the surge protector in parallel with the load. If the supply voltage is 100 to 200 V, insert the surge protector between the contacts.	The capacitance of the capacitor must be 1 to $0.5 \mu\text{F}$ per contact current of 1 A and resistance of the resistor must be 0.5 to 1Ω per contact voltage of 1 V. These values, however, vary with the load and the characteristics of the relay. Decide these values from testing, and take into consideration that the capacitance suppresses spark dis- charge when the contacts are sepa- rated and the resistance limits the current that flows into the load when the circuit is closed again. The dielectric strength of the capacitor must be 200 to 300 V. If the circuit is an
				AC circuit, use a capacitor with no polarity.
Diode method	No	Yes	The diode connected in parallel with the load changes energy accumulated by the coil into a current, which then flows into the coil so that the current will be converted into Joule heat by the resistance of the inductive load.	The reversed dielectric strength value of the diode must be at least 10 times as large as the circuit voltage value. The forward current of the diode must be the same as or larger than the load current.
			This time lag, between the moment the circuit is opened and the moment the load is reset, caused by this method is longer than that caused by the CR method.	The reversed dielectric strength value of the diode may be two to three times larger than the supply voltage if the surge protector is applied to electronic circuits with low circuit voltages.
Varistor method	Yes	Yes	The varistor method prevents the impo- sition of high voltage between the con- tacts by using the constant voltage characteristic of the varistor. There is time lag between the moment the cir- cuit is opened and the moment the load is reset.	
			If the supply voltage is 24 or 48 V, insert the varistor in parallel with the load. If the supply voltage is 100 to 200 V, insert the varistor between the con- tacts.	

When switching a load with a high inrush current, such as an incandescent lamp, suppress the inrush current as shown below.

Countermeasure 2

Providing a limiting resistor

Providing a dark current of approx. one-third of the rated value through an incandescent lamp

SECTION 1 PC Setup and Other Features

This section explains the PC Setup and other CQM1/CPM1A/SRM1 features, including interrupt processing and communications. The PC Setup can be used to control the operating parameters of the CQM1/CPM1A/SRM1. To change the PC Setup, refer to the *CQM1 Operation Manual*, *CPM1 Operation Manual* or *SRM1 Master Control Units Operation Manual* for Programming Console procedures. Refer to the *SSS Operation Manual*: *C-series PCs* for SSS procedures.

If you are not familiar with OMRON PCs or ladder diagram program, you can read *1-5 PC Setup* as an overview of the operating parameters available for the CQM1/CPM1A/SRM1, but may then want to read *SECTION 3 Memory Areas, SECTION 4 Ladder-diagram Programming*, and related instructions in *Section SECTION 5 Instruction Set* before completing this section.

1-1 PC Setup

The PC Setup comprises various operating parameters that control CQM1/ CPM1/CPM1A/SRM1 operation. In order to make the maximum use of CQM1/CPM1/CPM1A/SRM1 functionality when using interrupt processing and communications functions, the PC Setup may be customized according to operating conditions.

At the time of shipping, the defaults are set for general operating conditions, so that the CQM1/CPM1/CPM1A/SRM1 can be used without having to change the settings. You are, however, advised to check the default values before operation.

Default Values The default values for the PC Setup are 0000 for all words. The default values can be reset at any time by turning ON SR 25210.

Caution When data memory (DM) is cleared from a Programming Device, the PC Setup settings will also be cleared to all zeros.

1-1-1 Changing the PC Setup

PC Setup settings are accessed at various times depending on the setting, as described below.

- DM 6600 to DM 6614: Accessed only when PC's power supply is turned on.
- DM 6615 to DM 6644: Accessed only when program execution begins.
- DM 6645 to DM 6655: Accessed regularly when the power is on.

Since changes in the PC Setup become effective only at the times given above, the CQM1/CPM1/CPM1A/SRM1 will have to be restarted to make changes in DM 6600 to DM 6614 effective, and program execution will have to be restarted to make changes in DM 6615 to DM 6644 effective.

When DM 6602 bits 00 to 03 are set to protect the program memory, DM 6602 cannot be changed using the PC Setup operation of the Support Software. To change DM 6602, use the I/O Monitor or DM Edit operation.

Making Changes from a
Peripheral DeviceThe PC Setup can be read, but not written into, from the user program. Writ-
ing can be done only by using a Programming Device.

Although the PC Setup is stored in DM 6600 to DM 6655, settings can be made and changed only from a Programming Device (e.g., SSS, or Programming Console). DM 6600 to DM 6644 can be set or changed only while in PROGRAM mode. DM 6645 to DM 6655 can be set or changed while in either PROGRAM mode or MONITOR mode.

The following settings can be made in PROGRAM mode from the SSS using menu operations. All other settings must be made using the hexadecimal setting operation.

- Startup Mode (DM 6600)
- I/O Hold Bit Status and Forced Status Hold Bit Status (DM 6601)
- Cycle Monitor Time (DM 6618)
- Cycle Time (DM 6619)
- RS-232C Port Settings (DM 6645 to DM 6649)
- **Note** The RS-232C Port Settings (DM 6645 to DM 6649) are not used in CPM1/ CPM1A PCs because these PCs aren't equipped with an RS-232C port.

Errors in the PC Setup If an incorrect PC Setup setting is accessed, a non-fatal error (error code 9B) will be generated, the corresponding error flag (AR 2400 to AR 2402 in the CQM1, AR 1300 to AR 1302 in the CPM1/CPM1A/SRM1) will be turned ON, and the default setting will be used instead of the incorrect setting.

1-1-2 CQM1 PC Setup Settings

The PC Setup is broadly divided into four categories: 1) Settings related to basic CQM1 operation and I/O processes, 2) Settings related to pulse output functions, 3) Settings related to interrupts, and 4) Settings related to communications. This section will explain the settings according to these classifications.

The following table shows the setting in order in the DM area. For details, refer to the page numbers shown.

Word(s)	Bit(s)	Function	Page
Startup Proc	essing (D	M 6600 to DM 6614)	
The following	settings ar	e effective after transfer to the PC only after the PC is restarted.	
DM 6600	00 to 07	Startup mode (effective when bits 08 to 15 are set to 02). 00: PROGRAM; 01: MONITOR 02: RUN	16
	08 to 15	Startup mode designation 00: Programming Console switch 01: Continue operating mode last used before power was turned off 02: Setting in 00 to 07	
DM 6601	00 to 07	Not used.

	04 to 07	Not used.	1
	08 to 11	Cycle time monitor enable 0: Detect long cycles as non-fatal errors 1: Do not detect long cycles	
	12 to 15	Not used.	

Note

1. When the startup mode is set to continue the operating mode last used before the power was turned off, that operating mode will be retained by the built-in capacitor. If the power remains off for longer than the backup time of the capacitor, the data may be lost. (For details on the holding time, refer to the *CPM1A* or *CPM1 Operation Manual*.) Do not set to "05" to "07." If set to this value, the CPM1/CPM1A will not operate properly and the RUN PC Setup Error Flag (AR 1302 ON) will not turn ON.

3. Retention of IOM Hold Bit (SR 25212) Status

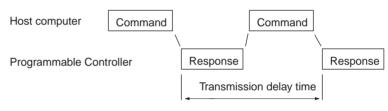

If the "IOM Hold Bit Status at Startup" (DM 6601, bits 08 to 11) is set to "Maintain" with the IOM Hold Bit (SR 25212) turned ON, operation can be started with the I/O memory (I/O, IR, LR) status just as it was before the power was turned OFF. (The input area is refreshed at startup, however, so it is overwritten by the most recently updated input status.)

Retention of Forced Status Hold Bit (SR 25211) Status

If the "Forced Status Hold Bit Status at Startup" (DM 6601, bits 12 to 15) is set to "Maintain" with the Forced Status Hold Bit (SR 25211) turned ON, operation can be started with the forced set/reset status just as it was before the power was turned OFF. (When starting up in RUN Mode, however, the forced set/reset status is cleared.)

Even if the "IOM Hold Bit Status at Startup" or "Forced Status Hold Bit Status at Startup" is set to "Maintain," the IOM Hold Bit (SR 25212) or Forced Status Hold Bit (SR 25211) status may be cleared if the power remains OFF for longer than the backup time of the built-in capacitor. (For details on the holding time, refer to the *CPM1A* or *CPM1 Operation Manual*.) At this time the I/O memory will also be cleared, so set up the system so that clearing the I/O memory will not cause problems.

4. The transmission delay is the delay between the previous transmission and the next transmission.

5. If an out-of-range value is set, the following communications conditions will result. In that case, reset the value so that it is within the permissible range.

Communications mode:	Host Link
Communications format:	Standard settings (1 start bit, 7-bit data; even parity, 2 stop bits, 9,600 bps)
Transmission delay:	No
Node number:	00

1-1-4 SRM1 PC Setup Settings

The PC Setup is broadly divided into three categories: 1) Settings related to basic PC operation and I/O processes, 2) Settings related to the cycle time, and 3) Settings related to communications. This section will explain the settings according to these classifications.

The following table shows the settings for SRM1 PCs in order. Refer to the page number in the last column for more details on that setting.

Note If an out-of-range value is set, the following communications conditions will result. In that case, reset the value so that it is within the permissible range.

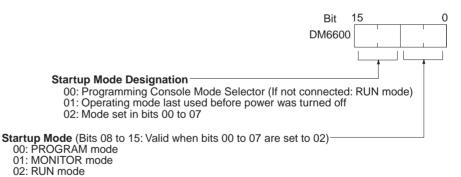

Communications mode:	Host Link		
Communications format:	Standard settings (1 start bit, 7-bit data; even parity, 2 stop bits, 9,600 bps)		
Transmission delay:	No		
Node number:	00		

1-2 Basic PC Operation and I/O Processes

This section explains the PC Setup settings related to basic operation and I/O processes.

1-2-1 Startup Mode

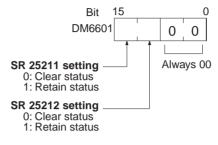

The operation mode the PC will start in when power is turned on can be set as shown below.

Default: Programming Console Mode Selector or RUN mode when Programming Console is not connected.

1-2-2 Hold Bit Status

Make the settings shown below to determine whether, when the power supply is turned on, the Forced Status Hold Bit (SR 25211) and/or IOM Hold Bit (SR 25212) will retain the status that was in effect when the power was last turned off, or whether the previous status will be cleared.

Default: Clear both.

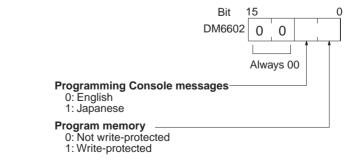

The Forced Status Hold Bit (SR 25211) determines whether or not the forced set/reset status is retained when changing from PROGRAM mode to MONI-TOR mode.

The IOM Hold Bit (SR 25212) determines whether or not the status of IR bits and LR bits is retained when PC operation is started and stopped.

- ▲ Caution Do not use the I/O Hold Bit Status and Forced Status Hold Bit Status Bits (DM 6601) when the power to the PC is going to be turned off longer than the memory backup time of the internal capacitor. If the memory backup time is exceeded, memory status will be unstable even if the I/O Hold Bit Status and Forced Status Hold Bit Status Bits are used. Unpredictable results may occur if operation is attempted with unstable memory status.
 - Note
 The memory backup time of the internal capacitor varies with the ambient temperature, but is 20 days at 25°C. Refer to hardware specifications for more details.
 - 2. The memory backup time assumes that the internal capacitor is fully charged before power is turned off. Fulling charging the capacitor requires that power is supplied to the CPU Unit for at least 15 minutes.

1-2-3 Program Memory Write-protection (CPM1/CPM1A Only)

In CPM1/CPM1A PCs the program memory can be protected by setting bits 00 to 03 of DM 6602 to 0. Bits 04 to 07 determine whether Programming Console messages are displayed in English or Japanese.

Note DM 6602 itself can still be changed after the program memory has been writeprotected by setting bits 04 to 07 of DM 6602 to 1.

1-2-4 RS-232C Port Servicing Time (CQM1/SRM1 Only)

The following settings are used to determine the percentage of the cycle time devoted to servicing the RS-232C port.

Example: If DM 6616 is set to 0110, the RS-232C port will be serviced for 10% of the cycle time.

The servicing time will be 0.34 ms minimum.

The entire servicing time will not be used unless processing requests exist.

1-2-5 Peripheral Port Servicing Time

The following settings are used to determine the percentage of the cycle time devoted to servicing the peripheral port.

Default: 5% of cycle time

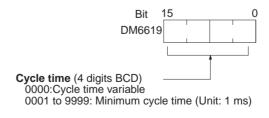

Example: If DM 6617 is set to 0115, the peripheral port will be serviced for 15% of the cycle time.

The servicing time will be 0.34 ms minimum.

The entire servicing time will not be used unless processing requests exist.

1-2-6 Cycle Time

Make the settings shown below to standardize the cycle time and to eliminate variations in I/O response time by setting a minimum cycle time.

Default: Cycle time variable

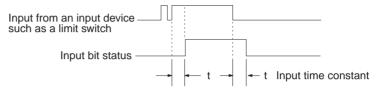

If the actual cycle time is shorter than the minimum cycle time, execution will wait until the minimum time has expired. If the actual cycle time is longer than

the minimum cycle time, then operation will proceed according to the actual cycle time. AR 2405 will turn ON if the minimum cycle time is exceeded.

1-2-7 Input Time Constants

Make the settings shown below to set the time from when the actual inputs from the DC Input Unit are turned ON or OFF until the corresponding input bits are updated (i.e., until their ON/OFF status is changed). Make these settings when you want to adjust the time until inputs stabilize.

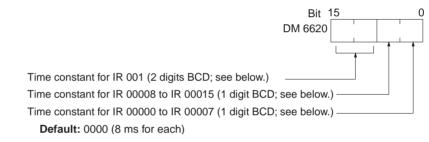

Increasing the input time constant can reduce the effects from chattering and external noise.

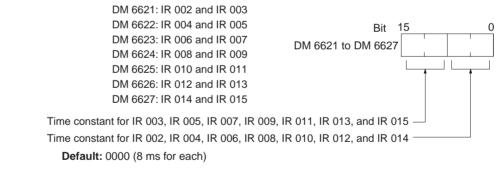

The SRM1 does not have this setting.

CQM1 PCs

DM 6620 contains the input time constants for both IR 000 and IR 001. Input Time Constants for IR 000 and IR 001

Input Time Constants for IR 002 to IR 015

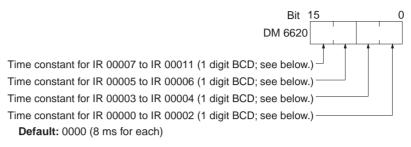

The nine possible settings for the input time constant are shown below. Set only the rightmost digit for IR 000.

0: 8 ms	1: 1 ms	2: 2 ms	3: 4 ms	4: 8 ms
5: 16 ms	6: 32 ms	7: 64 ms	8: 128 ms	

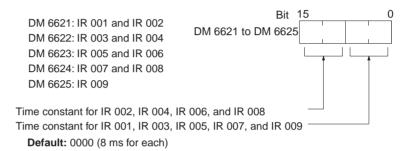

CPM1/CPM1A PCs

Set the input time constants for CPM1/CPM1A inputs from a Peripheral Device.

Input Time Constants for IR 000

Input Time Constants for IR 001 to IR 009

The nine possible settings for the input time constant are shown below. Set only the rightmost digit for IR 000.

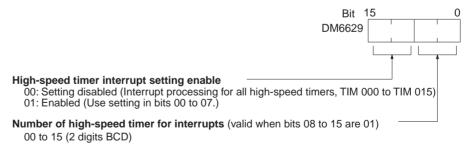

0: 8 ms	1: 1 ms	2: 2 ms	3: 4 ms	4: 8 ms
5: 16 ms	6: 32 ms	7: 64 ms	8: 128 ms	

The CPM1/CPM1A's I/O response time is the input time constant (1 ms to 128 ms; default is 8 ms) + the cycle time.

Refer to 7-2 CPM1/CPM1A Cycle Time and I/O Response Time for more details.

1-2-8 High-speed Timers (CQM1 Only)

Make the settings shown below to set the number of high-speed timers created with TIMH(15) that will use interrupt processing.

Default: Interrupt processing for all high-speed timers, TIM 000 to TIM 015.

The setting indicates the number of timers that will use interrupt processing beginning with TIM 000. For example, if "0108" is specified, then eight timers, TIM 000 to TIM 007 will use interrupt processing.

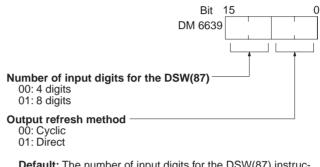

Note High-speed timers will not be accurate without interrupt processing unless the cycle time is 10 ms or less.

Interrupt response time for other interrupts will be improved if interrupt processing is set to 00 when high-speed timer processing is not required. This includes any time the cycle time is less than 10 ms.

Note If the SPED(64) instruction is used and pulses are output at a frequency of 500 Hz or greater, then set the number of high-speed timers with interrupt processing to four or less. Refer to information on the SPED(64) instruction for details.

1-2-9 DSW(87) Input Digits & Output Refresh Method (CQM1 Only)

Make the settings shown below to set the number of input digits the DSW(87) instruction, and to set the output refresh method.

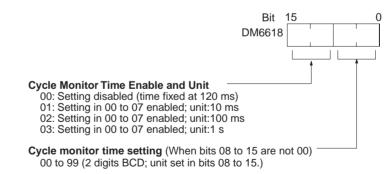

Default: The number of input digits for the DSW(87) instruction is set to "4" and the output refresh method is cyclic.

Refer to SECTION 2 Special Features for details on the DSW(87) instruction and to SECTION 7 PC Operations and Processing Time for details on I/O refresh methods.

1-2-10 Error Log Settings

Make the settings shown below for detecting errors and storing the error log.

Cycle Monitor Time (DM 6618)

Default: 120 ms.

The cycle monitor time is used for checking for extremely long cycle times, as can happen when the program goes into an infinite loop. If the cycle time exceeds the cycle monitor setting, a fatal error (FALS 9F) will be generated.

Note 1. The unit used for the maximum and current cycle times recorded in the AR area (AR 26 and AR 27 in the CQM1, AR 14 and AR 15 in the CPM1/CPM1A/SRM1) depend on the unit set for the cycle monitor time in DM 6618, as shown below.

0.1 ms
1 ms
10 ms

2. If the cycle time is 1 s or longer, the cycle time read from Programming Devices will be 999.9 ms. The correct maximum and current cycle times will be recorded in the AR area.

Example

If 0230 is set in DM 6618, an FALS 9F error will not occur until the cycle time exceeds 3 s. If the actual cycle time is 2.59 s, the current cycle time stored in the AR area will be 2590 (ms), but the cycle time read from a Programming Device will be 999.9 ms.

A "cycle time over" error (non-fatal) will be generated when the cycle time exceeds 100 ms unless detection of long cycle times is disable using the setting in DM 6655.

Error Detection and Error Log Operation (DM 6655)

Make the settings shown below to determine whether or not a non-fatal error is to be generated when the cycle time exceeds 100 ms or when the voltage of the built-in battery drops (CQM1 only), and to set the method for storing records in the error log when errors occur.

	Bit 15 DM6655	0	
Low battery voltage detection 0: Detect 1: Don't detect		Always 0	
Cycle time over detection 0: Detect 1: Don't detect			
Error log storage method 0: Error records for 10 (CQM1) ways stored (older errors delete 1: Only first 10 (CQM1) or 7 (SF stored beyond that point). 2 to F: Error records not stored.	ed). RM1/CPM1/CPM1A) error	,	

Default: Low battery voltage and cycle time over errors detected, and error records stored for the 10 most recent errors.

Battery errors and cycle time overrun errors are non-fatal errors.

For details on the error log, refer to SECTION 8 Troubleshooting.

Note The low battery error is applicable to CQM1 only. This digit isn't used in CPM1/CPM1A/SRM1 PCs.

1-3 Pulse Output Function (CQM1 Only)

This section explains the settings and methods for using the CQM1 pulse output function. Refer to the *CQM1 Operation Manual* for details on hardware connections to output points and ports.

1-3-1 Types of Pulse Outputs

All of the CQM1 PCs can output standard pulses from an output bit and the CQM1-CPU43-EV1 can also output standard or variable-duty-ratio pulses from ports 1 and 2. Standard pulse outputs have a duty ratio (t_{on}/T) of 50%. The duty ratio for variable-duty-ratio pulse outputs can be set from 1% to 99% in 1% increments.

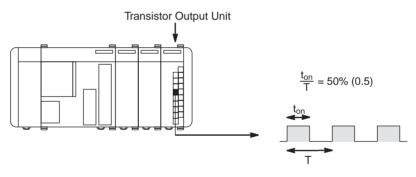

Note With the CQM1-CPU43-EV1, the pulse outputs described below can be output from three ports simultaneously. Furthermore, two ports can be used for counter inputs independent of the pulse output.

Standard Pulse Output Standard pulses (duty ratio = 50%) can be output from an output point with a from an Output Point frequency from 20 Hz to 1 kHz. The I/O word is specified in the PC Setup and the bit is specified in the pulse output instruction itself. Refer to page 23 for more details. **Standard Pulse Output** With the CQM1-CPU43-EV1, standard pulses (duty ratio = 50%) can be outfrom Ports 1 and 2 put from port 1 and/or 2 with a frequency from 10 Hz to 50 kHz (20 kHz max. to a stepping motor). The pulse output can be either clockwise (CW) or counter-clockwise (CCW) and frequency changes can be made smoothly. PLS2(---) and mode 0 of ACC(---) cannot be used when the PC Setup (DM 6611) is set to high-speed counter mode. CTBL(63) cannot be used with ports 1 and 2 when the PC Setup (DM 6611) is set to pulse output mode. Refer to page 25 for more details. Variable-duty-ratio Pulse With the CQM1-CPU43-EV1, variable-duty-ratio pulses (duty ratio = 0% to Output from Ports 1 and 2 99%) can be output from port 1 and/or 2 with frequencies of 91.6 Hz, 1.5 kHz, or 5.9 kHz. Only one direction can be output and the pulse output will continue until stopped with INI(61).

Refer to page 32 for more details.

1-3-2 Standard Pulse Output from an Output Point

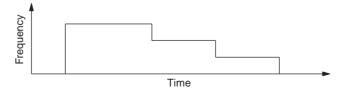

Standard pulses can be output from a specified output bit using SPED(64). Pulses can be output from just one bit at a time. The following diagram shows the pulses being output from the output point of the Transistor Output Unit mounted on a CQM1 PC. The duty ratio of the pulse output is 50% and the frequency can be set from 20 Hz to 1 kHz.

Note

- 1. A Transistor Output Unit must be used for this application.
 - 2. Pulses cannot be output when interval timer 0 is operating.
 - 3. When a pulse output higher than 500 Hz is being output, set the number of high-speed timers with interrupt processing to 4 by setting DM 6629 to 0104.

When outputting pulses from an output point, the frequency can be changed in steps by executing SPED(64) again with different frequencies, as shown in the following diagram.

There are two ways to stop the pulse output:

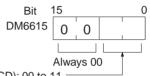

1,2,3... 1. After executing SPED(64), the pulse output will stop if INI(61) is executed with C=003 or SPED(64) is executed again with the frequency set to 0.

- 2. The total number of pulses that will be output can be set with PULS(65) before execution of SPED(64). In this case, SPED(64) must be executed in independent mode. The pulse output stops automatically when the number of pulses set by PULS(65) have been output.
- **Note** Refer to the sections on SPED(64) and PULS(65) for more details on these instructions.

PC Setup SettingsBefore executing SPED(64) to output pulses from an Output Unit, set the PC
to PROGRAM mode and make the following settings in the PC Setup.

In DM 6615, specify the output word that will be used for SPED(64) pulse output to Output Units. (The bit is specified in the first operand in SPED(64).)

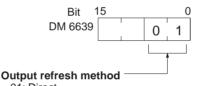

The content of DM 6615 (0000 to 0011) specifies output words IR 100 to IR 111. For example, if DM 6615 is set to 0002, pulses will be output to IR 102.

Output word (rightmost 2 digits, BCD): 00 to 11 -

Default: Pulse output to IR 100.

In the CQM1-CPU11/21-E CPUs, set direct output refreshing in DM 6639, as shown below. (In CQM1-CPU4□-EV1 CPU Units the output refresh method can be set to either direct or cyclic.)

01: Direct

Default: The default output refresh method is cyclic.

Continuous Pulse Output

Pulses will begin to be output at the specified output bit when SPED(64) is executed. Set the output bit from 00 to 15 (D=000 to 150) and the frequency from 20 Hz to 1000 Hz (F=0002 to 0100). Set the mode to continuous mode (M=001).

The pulse output can be stopped by executing INI(61) with C=003 or executing SPED(64) again with the frequency set to 0. The frequency can be changed by executing SPED(64) again with a different frequency setting.

The total number of pulses that will be output can be set with PULS(65) before executing SPED(64) in independent mode. The pulse output will stop automatically when the number of pulses set by PULS(65) have been output.

Execution condition	
	@PULS(65)
	000
	000
	P1
1	

Setting the Number of Pulses

PULS(65) sets the 8-digit number of pulses P1+1, P1. These pulses can be set from 00000001 to 16777215. The number of pulses set with PULS(65) is accessed when SPED(64) is executed in independent mode. (The number of pulses cannot be changed for pulses that are being output.)

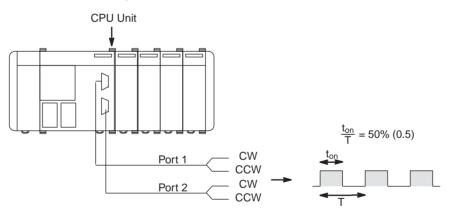

When SPED(64) is executed, pulses will begin to be output at the specified output bit (D=000 to 150: bit 00 to 15) at the specified frequency (F=0002 to 0100: 20 Hz to 1000 Hz). Set the mode to independent mode (M=001) to output the number of pulses set with PULS(65). The frequency can be changed by executing SPED(64) again with a different frequency setting.

Changing the Frequency The frequency of the pulse output can be changed by executing SPED(64) again with a different frequency setting. Use the same output bit (P) and mode (M) settings that were used to start the pulse output. The new frequency can be frequency 20 Hz to 1000 Hz (F=0002 to 0100).

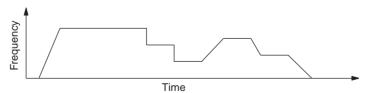

1-3-3 Standard Pulse Output from Ports 1 and 2

With the CQM1-CPU43-EV1, standard pulses can be output from ports 1 and 2 using SPED(64), PLS2(—), or ACC(—). The pulse frequency can be set from 10 Hz to 50 kHz (20 kHz max. to a stepping motor). The pulse output can be either clockwise (CW) or counter-clockwise (CCW) and frequency changes can be made smoothly.

Note Only the CQM1-CPU43-EV1 CPU Unit can output pulses from ports 1 and 2.

When outputting pulses from a port, the frequency can be changed smoothly or in steps with SPED(64), PLS2(—), and ACC(—), as shown in the following diagram.

There are two ways to stop the pulse output:

1,2,3... 1. After executing SPED(64), the pulse output will stop if INI(61) is executed with C=003 or SPED(64) is executed again with the frequency set to 0.

2. The total number of pulses that will be output can be set with PULS(65) before execution of SPED(64). In this case, SPED(64) must be executed in independent mode. The pulse output stops automatically when the number of pulses set by PULS(65) have been output.

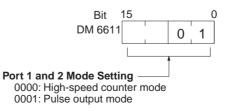

The following table shows the types of frequency changes that can be made with combinations of PULS(65), SPED(64), INI(61), PLS2(—), and ACC(—).

PC Setup Settings

Before outputting pulses from port 1 or 2, switch the PC to PROGRAM mode and make the following settings in the PC Setup.

In DM 6611, specify the mode setting for ports 1 and 2.

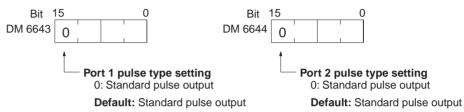

Default: The default mode setting is high-speed counter mode.

Some instructions cannot be used depending on the mode setting in DM 6611.

DM 6611 setting	Affected instructions
High-speed counter mode (0000)	PLS2(—) and mode 0 of ACC(—) cannot be used.
Pulse output mode (0001)	CTBL(63) cannot be used with ports 1 and 2.

The setting in DM 6611 is read only when the CQM1 is started. If this setting is changed, be sure to turn the PC off and then on again to make the new setting effective.

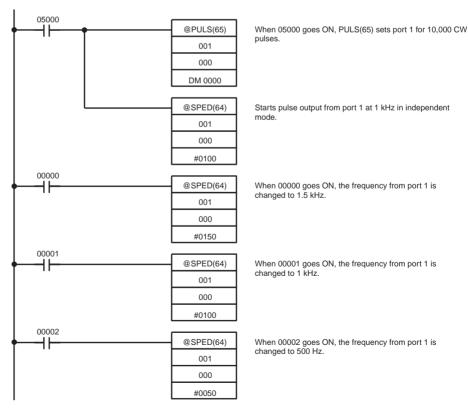

Specify standard pulse outputs in DM 6643 (port 1) and/or DM 6644 (port 2).

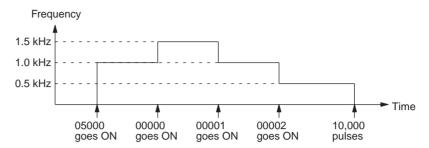

Variable-duty-ratio pulses cannot be output from a port if it has been set for standard pulse output in DM 6643 or DM 6644.

Example 1: Starting Pulse Output with PULS(65) and SPED(64) The following example shows PULS(65) and SPED(64) used to control a pulse output from port 1. The number of pulses specified in PULS(65) (10,000) are output as the frequency is changed by executions of SPED(64) with different frequency settings.

Before executing the program make sure that DM 6611 is set to 0001 (pulse output mode) and DM 6643 is set to 0000 (standard pulse setting for port 1).

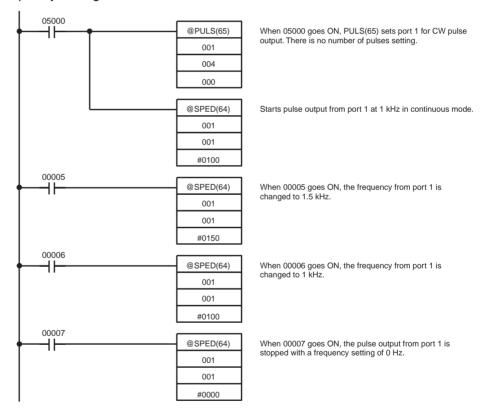

The following diagram shows the frequency of pulse outputs from port 1 as the program is executed.

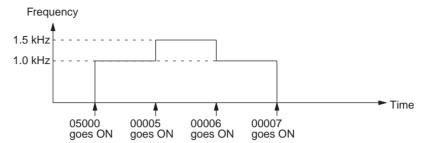

- **Caution** Be sure that the pulse frequency is within the motor's self-starting frequency range when starting and stopping the motor.
 - **Note** Speed control timing will be very accurate when frequency changes are performed as input interrupt processes.

Example 2: Stopping Pulse Output with SPED(64) The following example shows PULS(65) and SPED(64) used to control a pulse output from port 1. The frequency is changed by executions of SPED(64) with different frequency settings and finally stopped with a frequency setting of 0.

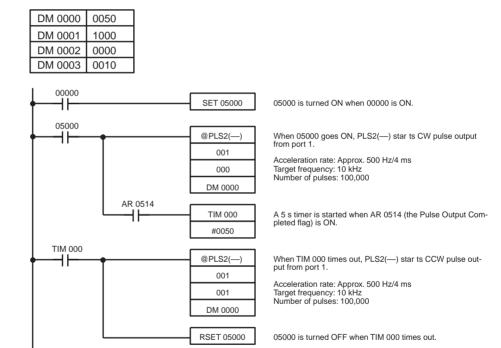

The following diagram shows the frequency of pulse outputs from port 1 as the program is executed.

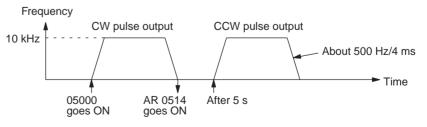

Caution Be sure that the pulse frequency is within the motor's self-starting frequency range when starting and stopping the motor.

Example 3: PLS2(- -)The following example shows PLS2(--) used to output 100,000 CW pulses
from port 1. The frequency is accelerated to 10 kHz at approximately 500 Hz/
4 ms and decelerated at the same rate.

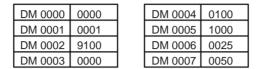

Five seconds after the CW pulses have been output, another PLS2(—) instruction outputs 100,000 CCW pulses with the same settings.

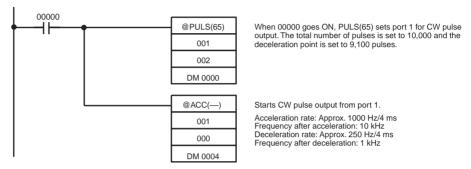

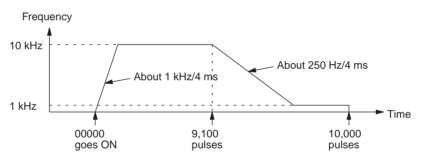

Example 4 :ACC(----) Mode 0 The following example shows mode 0 of ACC(—) used to output 10,000 CW pulses from port 1. The frequency is accelerated to 10 kHz at approximately 1 kHz/4 ms and decelerated to 1 kHz at approximately 250 Hz/4 ms. Deceleration begins after 9,100 pulses have been output.

The following diagram shows the frequency of pulse outputs from port 1 as the program is executed.

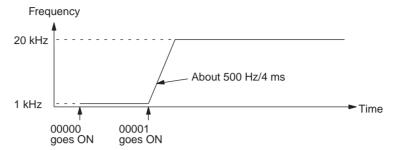

Example 5: ACC(----) Mode 1 The following example shows mode 1 of ACC(—) used increase the frequency of a pulse output from port 1. The frequency is accelerated from 1 kHz to 20 kHz at approximately 500 Hz/4 ms.

The following diagram shows the frequency of pulse outputs from port 2 as the program is executed.

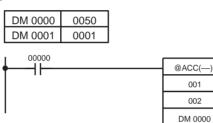

Example 6: ACC(---) Mode 2

Example 7: ACC(---)

Mode 3

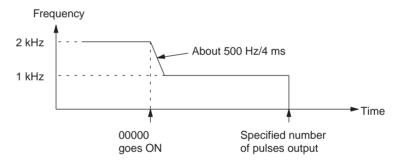

The following example shows mode 2 of ACC(---) used decrease the frequency of a pulse output from port 1. The 2-kHz pulse output is already in progress in independent mode and stops automatically when the number of pulses is reached.

When 00000 goes ON, ACC(—) begins deceler ating the port 1 pulse output at about 500 Hz/4 ms until it reaches the target frequency of 10 Hz.

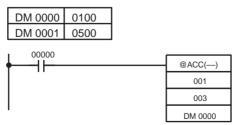

The following diagram shows the frequency of pulse outputs from port 1 as the program is executed.

001 002

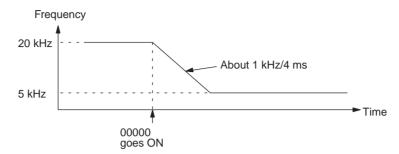

Note The pulse output can be stopped by executing ACC(—) mode 2 with a target frequency of 0, but the pulse output cannot be stopped at the correct number of pulses, so this method should not be used except for emergency stops.

The following example shows mode 3 of ACC(---) used decrease the frequency of a pulse output from port 1. The 20-kHz pulse output is already in progress in continuous mode.

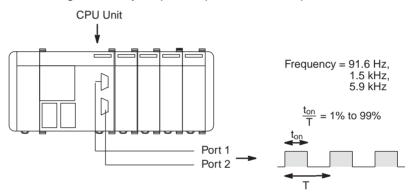

When 00000 goes ON, ACC(—) begins deceler ating the port 1 pulse output at about 1 kHz/4 ms until it reaches the target frequency of 5 kHz.

The following diagram shows the frequency of pulse outputs from port 1 as the program is executed.

1-3-4 Variable-duty-ratio Pulse Output from Ports 1 and 2

With the CQM1-CPU43-EV1, variable-duty-ratio pulses can be output from ports 1 and/or 2 using PWM(—). The pulse frequency can be set to 91.6 Hz, 1.5 kHz, or 5.9 kHz. This function can be used for various kinds of control outputs, such as light intensity output or speed control output to an inverter.

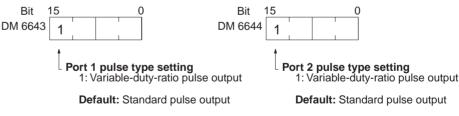

Note Only the CQM1-CPU43-EV1 CPU Unit can output pulses from ports 1 and 2.

PC Setup Settings

Before outputting variable-duty-ratio pulses from port 1 or 2, switch the PC to PROGRAM mode and make the following settings in the PC Setup.

Specify variable-duty-ratio pulse outputs in DM 6643 (port 1) and/or DM 6644 (port 2).

Standard pulses cannot be output from a port if it has been set for standard variable-duty-ratio pulse output in DM 6643 or DM 6644.

Starting the Pulse Output

Pulses will begin to be output from the specified port when PWM(-) is executed. Specify port 1 or 2 (P=001 to 002). Set the frequency to 5.9 kHz, 1.5 kHz, or 91.6 Hz (F=000, 001, or 002). Set the duty ratio from 1% to 99% (D=0001 to 0099, BCD).

The pulse output will continue with the specified frequency and duty ratio until PWM(—) is executed again with different settings or INI(61) is executed to stop pulse outputs from the specified port.

Stopping the Pulse Output The pulse output from a port can be stopped by executing INI(61) with C=003. Specify port 1 or 2 (P=001 to 002).

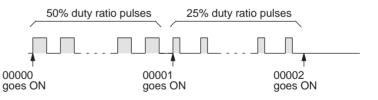

Example: Using PWM(—) The following example shows PWM(—) used to start a 1.5 kHz pulse output from port 1 and change the duty ratio from 50% to 25%. The pulse output is then stopped with INI(61).

Before executing the program make sure that DM 6643 is set to 1000 (variable-duty-ratio pulse setting for port 1).

	000	

The following diagram shows the duty ratio of the pulse output from port 1 as the program is executed.

1-3-5 Determining the Status of Ports 1 and 2

The status of pulse outputs (for standard or variable-duty-ratio pulses) of ports 1 and 2 can be determined either by reading the status of the relevant flags in the SR and AR areas or by executing PRV(62).

Reading Flag Status

The status of pulse outputs can be determined by reading the contents of the words and flags shown in the following table.

Word(s)	Bit(s)	Function	Description
SR 236 and SR 237	00 to 15	Port 1 PV	Indicates the 8-digit present value of the number of pulses output from port 1. SR 237 contains the higher four digits.
SR 238 and SR 239	00 to 15	Port 2 PV	Indicates the 8-digit present value of the number of pulses output from port 2. SR 239 contains the higher four digits.
AR 04	08 to 15	Pulse output status	Indicates pulse output status.
			00: normal 01 or 02: Hardware error 03: PC Setup error 04: Operation stopped during pulse output
AR 05	12	Port 1 Deceleration flag	Indicates deceleration. (0: Not specified; 1: Specified.)
	13	Port 1 Number of Pulses flag	Indicates whether the number of pulses are set. (0: Not specified; 1: Specified.)
	14	Port 1 Pulse Output Completed flag	Indicates whether pulse output has been completed. (0: Not completed; 1: Completed.)
	15	Port 1 Pulse Output Status flag	Indicates whether pulses are being output. (0: No output; 1: Output in progress.)
AR 06	12	Port 2 Deceleration flag	Indicates deceleration. (0: Not specified; 1: Specified.)
	13	Port 2 Number of Pulses flag	Indicates whether the number of pulses are set. (0: Not specified; 1: Specified.)
	14	Port 2 Pulse Output Completed flag	Indicates whether pulse output has been completed. (0: Not completed; 1: Completed.)
	15	Port 2 Pulse Output Status flag	Indicates whether pulses are being output. (0: No output; 1: Output in progress.)

Executing PRV(62)

The status of pulse outputs can be determined by executing PRV(62). Specify port 1 or 2 (P=001 to 002) and the destination word D. The port status information will be written to bits 04 to 07 of D and bits 00 to 03 and 08 to 15 will be set to 0.

When PRV(62) is used to read the port's status, the most recent information will be read, so the PC's cycle time will not be a factor.

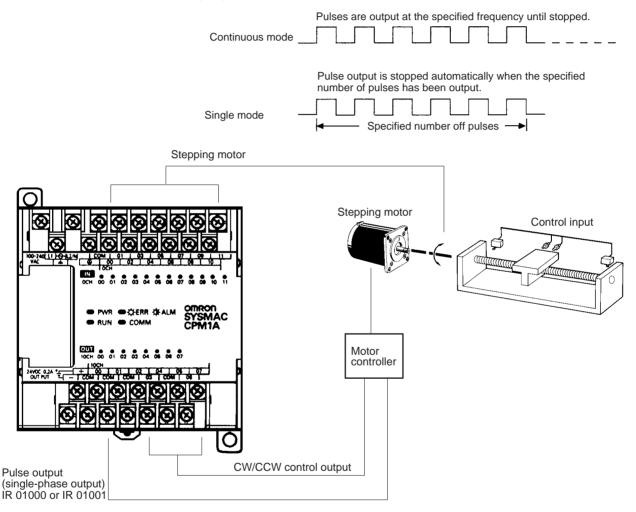

Bits 04 through 07 of D contain the specified port's status information.

Bit	Function	Description
04	Deceleration flag	Indicates deceleration. (0: Not decelerating; 1: Decelerating)
05	Number of Pulses flag	Indicates whether the total number of pulses have been specified. (0: Not specified; 1: Specified.)
06	Pulse Output Com- pleted flag	Indicates whether pulse output has been completed. (0: Not completed; 1: Completed.)
07	Pulse Output Status flag	Indicates whether pulses are being output. (0: No output; 1: Output in progress.)

1-4 Pulse Output Function (CPM1A Only)

The CPM1A PCs with transistor outputs have a pulse output function capable of outputting a pulse of 20 Hz to 2 kHz (single-phase). Either IR 01000 or IR 01001 can be selected for pulse output, and the pulse output can be set to either the continuous mode, under which the output can be stopped by an instruction, or the independent mode, under which the output is stopped after a preset number of pulses (1 to 16,777,215).

Refer to the *CPM1A Operation Manual* for details on hardware connections to output points and ports.

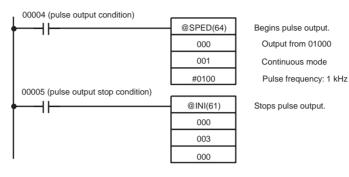

Note

- The CPM1A uses a single-phase pulse output. The control signal for the direction of rotation (CW/CCW) for the motor driver must be written in the program.
 - 2. Be sure to use a CPU Unit with transistor outputs.

1-4-1 Programming Example in Continuous Mode

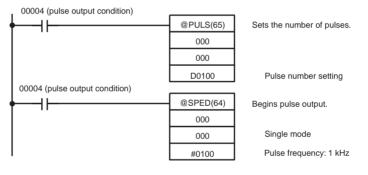

In this example program, pulse output begins from IR 01000 when input IR 00004 turns ON, and is stopped when input IR 00005 turns ON.

SPED(64) can be used to stop pulse output. When using SPED(64) for that purpose, specify #0000 (constant or word contents) as the pulse frequency.

1-4-2 Programming Example in Independent Mode

In this example program, pulse output begins from IR 01000 when input IR 00004 turns ON, and is stopped after the specified number of pulses have been output. The pulse amount is set in DM 0100 and DM 0101.

1-4-3 Using Pulse Output Instructions

Setting the Number of Pulses

Before beginning pulse output using the independent mode use PULS(65) as shown below to set the number of pulses to be output. This setting is not required for the continuous mode.

@PULS(65)
000
000
N

In N, set the beginning word address of the words where the number of pulses is set. Store the number of pulses in words N and N+1, in eight digits BCD, with the leftmost four digits in N+1 and the rightmost four digits in N.

Make the setting within a range of 00000001 to 16777215 (BCD).

Beginning Pulse output

With SPED(64), set the bit location for pulse outputs (IR 01000 or IR 01001), the output mode (independent, continuous), and the pulse frequency to begin the pulse output.

@SPED(64)	
Р	
М	
F	
P (3 digits BCD)	000: Outputs to IR 01000
	010: Outputs to IR 01001
M (3 digits BCD)	000: Independent mode
	001 Continuous mode
F (4 digits BCD)	For the beginning pulse output frequency, specify a
	constant or word contents. The specified value and
	set frequency are as follows:
	Specified value: 0002 to 0200
	Set frequency: 20 to 2,000 Hz
oto 1 Pulses can be o	utput from only one bit at a time

Note 1. Pulses can be output from only one bit at a time.

2. When pulse output is begun in independent mode, the number of pulses is read when SPED(64) is executed. PULS(65) cannot be used to change the number of pulses while pulses are being output.

1-4-4 Changing the Frequency

To change the frequency during pulse output, change the frequency setting with SPED(64). At that time, set the operands other than the frequency to the same settings as at the beginning of pulse output.

P (3 digits BCD) M (3 digits BCD) F (4 digits BCD) Same as at beginning of pulse output.

Same as at beginning of pulse output.

For the changed pulse output frequency, specify a constant or word contents. The specified value and set frequency are as follows:

Specified value:	0002 to 0200
Set frequency:	20 to 2,000 Hz

1-4-5 Stopping Pulse Output

When pulses are output in the independent mode, the pulse output will automatically stop after the number of pulses specified with PULS(65) has been output. When pulses are output in the continuous mode, either of the following two methods can be used to stop the pulse output.

The first method is to use SPED(64) to stop the pulse output by setting the

1. Use SPED(64) to set the frequency to 0.

2. Use INI(61) to stop the pulse output.

Using SPED(64)

Using INI(61)

frequency to 0. For details, refer to *1-4-4 Changing the Frequency*. The second method is to use INI(61) to stop the pulse output, as follows:

 @INI(61)
000
003
000

1-5 CQM1 Interrupt Functions

This section explains the settings and methods for using the CQM1 interrupt functions.

1-5-1 Types of Interrupts

The CQM1 has three types of interrupt processing, as outlined below.

Input interrupts:

Interrupt processing is executed when an input from an external source turns ON one of CPU bits 00000 to 00003.

Interval timer interrupts:

Interrupt processing is executed by an interval timer with a precision of 0.1 ms.

High-speed counter interrupts:

Interrupt processing is executed according to the present value (PV) of a builtin high-speed counter. All CQM1 CPU Units are equipped with high-speed counter 0, which counts pulse inputs to one of CPU bits 00004 to 00006. Twophase pulses up to 2.5 kHz can be counted.

The CQM1-CPU43/44-EV1 CPU Units can also count inputs to ports 1 and 2:

CQM1-CPU 43-EV1: High-speed counters 1 and 2 count high-speed pulse inputs to ports 1 and 2. Two-phase pulses up to 25 kHz can be counted.

CQM1-CPU44-EV1: High-speed counters 1 and 2 count absolute rotary encoder codes input to ports 1 and 2.

Interrupt Processing When an interrupt is generated, the specified interrupt processing routine is executed. Interrupts have the following priority ranking. (Input interrupt 0 has the highest priority and high-speed counter interrupt 0 has the lowest.)

- 1,2,3... 1. Input interrupt 0 > Input interrupt 1 > Input interrupt 2 > Input interrupt 3
 - 2. High-speed counter interrupt 1 > High-speed counter interrupt 2
 - Interval timer interrupt 0 > Interval timer interrupt 1 > Interval timer interrupt 2 (Interval timer interrupt 2 is high-speed counter interrupt 0.)

When an interrupt with a higher priority is received during interrupt processing, the current processes will be stopped and the newly received interrupt will be processed instead. After that routine has been completely executed, then processing of the previous interrupt will be resumed.

When an interrupt with a lower or equal priority is received during interrupt processing, then the newly received interrupt will be processed as soon as the routine currently being processed has been completely executed.

Just as with ordinary subroutines, interrupt processing routines are defined using SBN(92) and RET(93) at the end of the main program.

When interrupt processing routines are executed, a specified range of input bits can be refreshed.

When an interrupt processing routine is defined, a "no SBS error" will be generated during the program check but execution will proceed normally. If this error occurs, check all normal subroutines to be sure that SBS(91) has been programmed before proceeding.

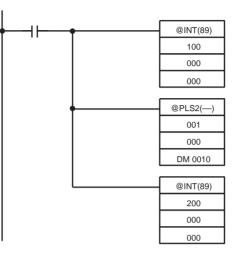

Pulse Output Instructions and Interrupts With the CQM1-CPU43/44-EV1 CPU Units, the following instructions cannot be executed in an interrupt subroutine when an instruction that controls pulse I/O or high-speed counters is being executed in the main program: (25503 turns ON)

Section 1-5

The following methods can be used to circumvent this limitation:

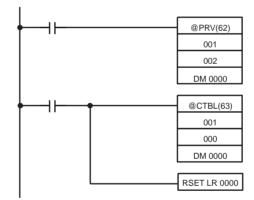

Method 1

All interrupt processing can be masked while the instruction is being executed.

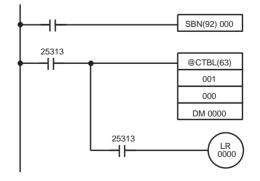

Method 2

Execute the instruction again in the main program. This is the program section from the main program:

This is the program section from the interrupt subroutine:

1-5-2 Input Interrupts

The CPU Unit's inputs allocated IR 00000 to IR 00003 can be used for interrupts from external sources. Input interrupts 0 through 3 correspond respectively to these bits and are always used to call the subroutines numbered 000 through 003 respectively. When input interrupts are not used, subroutine numbers 000 to 003 can be used for ordinary subroutines.

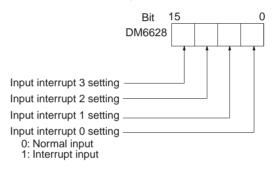

Processing There are two modes for processing input interrupts. The first is the Input Interrupt Mode, in which the interrupt is carried out in response to an external input. The second is the Counter Mode, in which signals from an external source are counted at high speed, and an interrupt is carried out once for every certain number of signals.

In the Input Interrupt Mode, signals with a length of 100 μ s or more can be detected. In the Counter Mode, signals up to 1 kHz can be counted.

PC Setup Parameters Before executing the program, make the following settings in the PC Setup in PROGRAM mode.

Interrupt Input Settings (DM 6628)

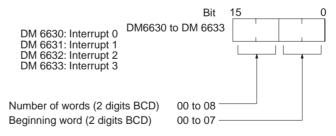

If these settings are not made, interrupts cannot be used in the program.

Default: All normal inputs.

Input Refresh Word Settings (DM 6630 to DM 6633)

Make these settings when it is necessary to refresh inputs.

Example: If DM 6630 is set to 0100, IR 000 will be refreshed when a signal is received for interrupt 0.

Note If input refreshing is not used, input signal status within the interrupt routine will not be reliable. This includes even the status of the interrupt input bit that activated the interrupt. For example, IR 00000 would not be ON in interrupt routine for input interrupt 0 unless it was refreshed (in this case, the Always ON Flag, SR 25313 could be used in place of IR 00000).

Use the following instructions to program input interrupts using the Input Interrupt Mode.

Masking of Interrupts

With the INT(89) instruction, set or clear input interrupt masks as required.

 (@)INT(89)	
	000
	000
	D

Make the settings with the D bits 0 to 3, which correspond to input interrupts 0 to 3.

0: Mask cleared. (Input interrupt permitted.)

1: Mask set. (Input interrupt not permitted.)

At the beginning of operation, all of the input interrupts are masked.

Clearing Masked Interrupts

If the bit corresponding to an input interrupt turns ON while masked, that input interrupt will be saved in memory and will be executed as soon as the mask is cleared. In order for that input interrupt not to be executed when the mask is cleared, the interrupt must be cleared from memory.

Only one interrupt signal will be saved in memory for each interrupt number.

With the INT(89) instruction, clear the input interrupt from memory.

 (@)INT(89)		
	001	
	000	
	D	

If D bits 0 to 3, which correspond to input interrupts 0 to 3, are set to "1," then the input interrupts will be cleared from memory. 0: Input interrupt retained.

1: Input interrupt cleared.

Reading Mask Status

With the INT(89) instruction, read the input interrupt mask status.

_	(@)INT(89)		
		002	
		000	
		D	

The status of the rightmost digit of the data stored in word D (bits 0 to 3) show the mask status.

0: Mask cleared. (Input interrupt permitted.)

1: Mask set. (Input interrupt not permitted.)

Counter Mode

Use the following steps to program input interrupts using the Input Interrupt Mode.

- Note The SR words used in the Counter Mode (SR 244 to SR 251) all contain binary (hexadecimal) data (not BCD).
- 1,2,3... 1. Write the set values for counter operation to SR words correspond to interrupts 0 to 3. The set values are written between 0000 and FFFF (0 to 65,535). A value of 0000 will disable the count operation until a new value is set and step 2, below, is repeated.
 - Note These SR bits are cleared at the beginning of operation, and must be written from the program.

That maximum input signal that can be counted is 1 kHz.

Interrupt	Word
Input interrupt 0	SR 244
Input interrupt 1	SR 245
Input interrupt 2	SR 246
Input interrupt 3	SR 247

If the Counter Mode is not used, these SR bits can be used as work bits.

2. With the INT(89) instruction, refresh the Counter Mode set value and enable interrupts.

 (@)INT(89) 003	If D bits 0 to 3, which correspond to input interrupts 0 to 3, are set to "0," then the set value will be refreshed and interrupts will be permitted.
000	0: Counter mode set value refreshed and mask cleared.
D	1: Nothing happens. (Set to 1 the bits for all interrupts that are not being changed.)

The input interrupt for which the set value is refreshed will be enabled in Counter Mode. When the counter reaches the set value, an interrupt will occur, the counter will be reset, and counting/interrupts will continue until the counter is stopped.

- **Note** 1. If the INT(89) instruction is used during counting, the present value (PV) will return to the set value (SV). You must, therefore, use the differentiated form of the instruction or an interrupt may never occur.
 - The set value will be set when the INT(89) instruction is executed. If interrupts are already in operation, then the set value will not be changed just by changing the content of SR 244 to SR 247, i.e., if the contents is changed, the set value must be refreshed by executing the INT(89) instruction again.

Interrupts can be masked using the same process as for the Input Interrupt Mode, but is masked are cleared using the same process, the Counter Mode will not be maintained and the Input Interrupt Mode will be used instead. Interrupt signals received for masked interrupts can also be cleared using the same process as for the Input Interrupt Mode.

Counter PV in Counter Mode

When input interrupts are used in Counter Mode, the counter PV will be stored in the SR word corresponding to input interrupts 0 to 3. Values are 0000 to FFFE (0 to 65,534) and will equal the counter PV minus one.

Interrupt	Word
Input interrupt 0	SR 248
Input interrupt 1	SR 249
Input interrupt 2	SR 250
Input interrupt 3	SR 251

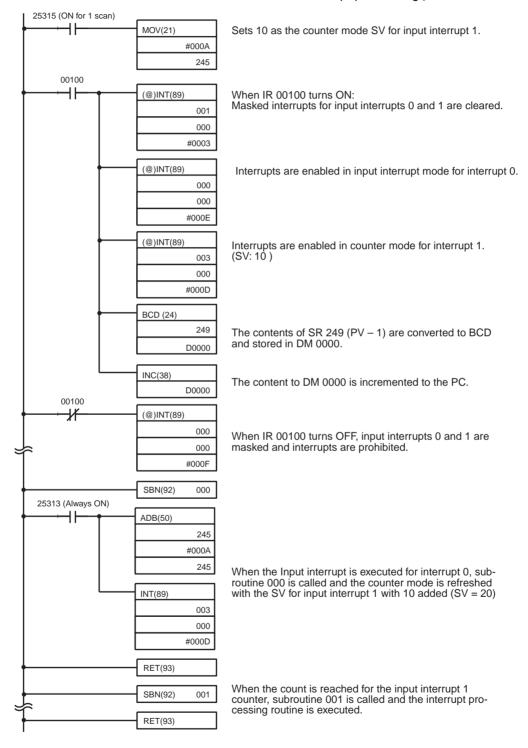

Example: The present value for an interrupt whose set value is 000A will be recorded as 0009 immediately after INT(89) is executed.

Note Even if input interrupts are not used in Counter Mode, these SR bits cannot be used as work bits.

Application Example

In this example, input interrupt 0 is used in Input Interrupt Mode and input interrupt 1 is used in Counter Mode. Before executing the program, check to be sure the PC Setup.

PC Setup: DM 6628: 0011 (IR 00000 and IR 00001 used for input interrupts) The default settings are used for all other PC Setup parameters. (Inputs are not refreshed at the time of interrupt processing.)

CQM1 Interrupt Functions

diagram. 00000 Subroutine 000 00001 Subroutine 001 Subroutine 001 (see note 1) 00100 (see note 1) (see note 2)

Note 1. The counter will continue operating even while the interrupt routine is being executed.

When the program is executed, operation will be as shown in the following

2. The input interrupt will remained masked.

1-5-3 Masking All Interrupts

All interrupts, including input interrupts, interval timer interrupts, and highspeed counter interrupts, can be masked and unmasked as a group by means of the INT(89) instruction. The mask is in addition to any masks on the individual types of interrupts. Furthermore, clearing the masks for all interrupts does not clear the masks on the individual types of interrupts, but restores them to the masked conditions that existed before INT(89) was executed to mask them as a group.

Do not use INT(89) to mask interrupts unless it is necessary to temporarily mask all interrupts and always use INT(89) instructions in pairs to do so, using the first INT(89) instruction to mask and the second one to unmask interrupts.

INT(89) cannot be used to mask and unmask all interrupts from within interrupt routines.

Masking Interrupts Use the INT(89) instruction to disable all interrupts.

_	(@)INT(89)	
		100
		000
		000

If an interrupt is generated while interrupts are masked, interrupt processing will not be executed but the interrupt will be recorded for the input, interval timer, and high-speed counter interrupts. The interrupts will then be serviced as soon as interrupts are unmasked.

Unmasking Interrupts

Use the INT(89) instruction to unmask interrupts as follows:

 (@)INT(89)	
	200
	000
	000

Section 1-5

1-5-4 Interval Timer Interrupts

High-speed, high-precision timer interrupt processing can be executed using interval timers. The CQM1 provides three interval timers, numbered from 0 to 2.

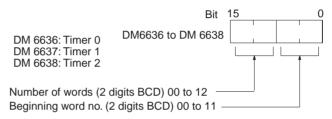

- **Note** 1. Interval timer 0 cannot be used when pulses are being output to Output Units by means of the SPED(64) instruction.
 - 2. Interval timer 2 cannot be used at the same time as the high-speed counter.

Processing There are two modes for interval timer operation, the One-shot Mode, in which only one interrupt will be executed when time expires, and the Sched-uled Interrupt Mode in which the interrupt is repeated at a fixed interval.

PC Setup When using interval timer interrupts, make the following settings in the PC Setup in PROGRAM mode before executing the program.

Input Refresh Word Settings (DM 6636 to DM 6638)

Make these settings when it is necessary to refresh inputs.

Default: No input refresh

High-speed Counter Settings (DM 6642)

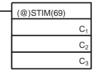

When using interval timer 2, check before beginning operation to be sure that the high-speed counter (PC Setup: DM 6642) is set to the default setting (0000: High-speed counter not used).

Operation

Starting Up in One-Shot Mode

Use the STIM(69) instruction to start the interval timer in the one-shot mode.

Use the following instruction to activate and control the interval timer.

C₁: Interval timer no. Interval timer 0: 000 Interval timer 1: 001 Interval timer 2: 002 C₂: Timer set value (first word address) C₃: Subroutine no. (4 digits BCD): 0000 to 0255

C₂: Decrementing counter set value (4 digits BCD): 0000 to 9999

 C_2 + 1: Decrementing time interval (4 digits BCD; unit: 0.1 ms): 0005 to 0320 (0.5 ms to 32 ms)

Each time that the interval specified in word $C_2 + 1$ elapses, the decrementing counter will decrement the present value by one. When the PV reaches 0, the designated subroutine will be called just once and the timer will stop.

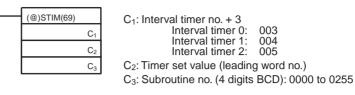

The time from when the STIM(69) instruction is executed until time elapses is calculated as follows:

(Contents of word C₂) x (Contents of word C₂ + 1) x 0.1 ms = (0.5 to 319,968 ms)

If a constant is set for C_2 , then the set value of the decrementing counter will take that value and the decrementing time interval will be 10 (1 ms). (The set value is expressed in ms.)

Starting Up in Scheduled Interrupt Mode

Use the STIM(69) instruction to start the interval timer in the scheduled interrupt mode.

C₂: Decrementing counter set value (4 digits BCD): 0000 to 9999

 $\overline{C_2}$ + 1: Decrementing time interval (4 digits BCD; unit: 0.1 ms): 0005 to 0320 (0.5 ms to 32 ms)

The meanings of the settings are the same as for the one-shot mode, but in the scheduled interrupt mode the timer PV will be reset to the set value and decrementing will begin again after the subroutine has been called. In the scheduled interrupt mode, interrupts will continue to be repeated at fixed intervals until the operation is stopped.

Note CQM1-CPU11-E/CPU21-E support subroutine numbers 0000 to 0127 only.

Reading the Timer's Elapsed Time

Use the STIM(69) instruction to read the timer's elapsed time.

C₁: Interval timer no. + 6 Interval timer 0: 006 Interval timer 1: 007 Interval timer 2: 008 C₂: Leading word of parameter 1 C₃: Parameter 2

 C_2 : Number of times the decrementing counter has ben decremented (4 digits BCD)

 C_2 + 1: Decrementing counter time interval (4 digits BCD; unit: 0.1 ms) C_3 : Elapsed time from previous decrement (4 digits BCD; unit: 0.1 ms)

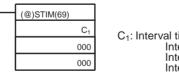

The time from when the interval timer is started until the execution of this instruction is calculated as follows:

{(Contents of word C2) x (Contents of word C2 + 1) + (Contents of word C3)} x 0.1 ms

If the specified interval timer is stopped, then "0000" will be stored.

Stopping Timers

Use the STIM(69) instruction to stop the interval timer.

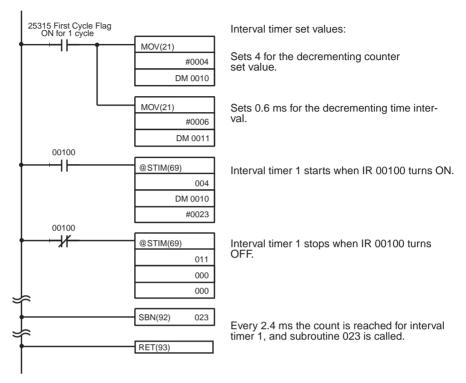

nterval timer no. + 10	
Interval timer 0:	010
Interval timer 1:	011
Interval timer 2:	012

The specified interval timer will stop.

Application Example

In this example, an interrupt is executed every 2.4 ms (0.6 ms x 4) by means of interval timer 1. Assume the default settings for all of the PC Setup. (Inputs are not refreshed for interrupt processing.)

When the program is executed, subroutine 023 will be executed every 2.4 ms while IR 00100 is ON.

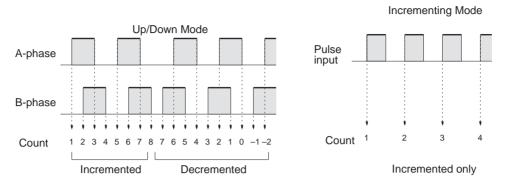

1-5-5 High-speed Counter 0 Interrupts

Pulse signals from a pulse encoder to CPU bits 00004 through 00006 can be counted at high speed, and interrupt processing can be executed according to the count.

Processing

Input Signal Types and Count Modes Two types of signals can be input from a pulse encoder. The count mode used for high-speed counter 0 will depend on the signal type.

Up/Down Mode: A phase-difference 4X two-phase signal (A-phase and Bphase) and a Z-phase signal are used for inputs. The count is incremented or decremented according to differences in the 2-phase signals. Incrementing mode: One single-phase pulse signal and a count reset signal are used for inputs. The count is incremented according to the single-phase signal.

Note One of the methods in the following section should always be used to reset the counter when restarting it. The counter will be automatically reset when program execution is started or stopped.

The following signal transitions are handled as forward (incrementing) pulses: A-phase leading edge to B-phase leading edge to A-phase trailing edge to Bphase trailing edge. The following signal transitions are handled as reverse (decrementing) pulses: B-phase leading edge to A-phase leading edge to Bphase trailing edge to A-phase trailing edge.

The count range is from -32,767 to 32,767 for Up/Down Mode, and from 0 to 65,535 for Incrementing Mode. Pulse signals can be counted at up to 2.5 kHz in Up/Down Mode, and up to 5.0 kHz in Incrementing Mode.

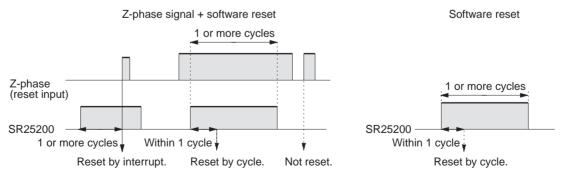

The Up/Down Mode always uses a 4X phase-difference input. The number of counts for each encoder revolution would be 4 times the resolution of the counter. Select the encoder based on the countable ranges.

Reset Methods

Either of the two methods described below may be selected for resetting the PV of the count (i.e., setting it to 0).

Z-phase signal + software reset: The PV is reset when the Z-phase signal (reset input) turns ON after the High-speed Counter 0 Reset Bit (SR 25200) is turned ON.

Software reset: The PV is reset when the High-speed Counter 0 Reset Bit (SR 25200) is turned ON.

Note The High-speed Counter 0 Reset Bit (SR 25200) is refreshed once every cycle, so in order for it to be read reliably it must be ON for at least one cycle.

The "Z" in "Z-phase" is an abbreviation for "Zero." It is a signal that shows that the encoder has completed one cycle.

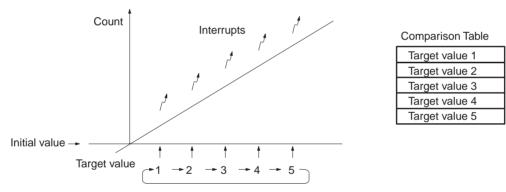

High-speed Counter Interrupt Count

For high-speed counter 0 interrupts, a comparison table is used instead of a "count up." The count check can be carried out by either of the two methods described below. In the comparison table, comparison conditions (for comparing to the PV) and interrupt routine combinations are saved.

Target value: A maximum of 16 comparison conditions (target values and count directions) and interrupt routine combinations are saved in the comparison table. When the counter PV and the count direction match the comparison conditions, then the specified interrupt routine is executed.

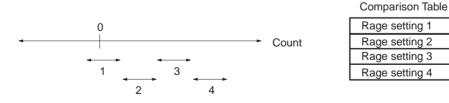

Range comparison: Eight comparison conditions (upper and lower limits) and interrupt routine combinations are saved in the comparison table. When the PV is greater than or equal to the lower limit and less than or equal to the upper limit, then the specified interrupt routine is executed.

Target Value Comparisons The current count is compared to the target values in the order that target values are set in the comparison table and interrupts are generated as the count equals each target value. Once the count has equaled all of the target values in the table, the target value is set to the first target value in the table, which is again compared to the current counted until the two values are equal.

Range Comparisons

The current count is compared in cyclic fashion to all of the ranges at the same time and interrupts are generated based on the results of the comparisons.

Note When performing target value comparisons, do not repeatedly use the INI instruction to change the current value of the count and start the comparison operation. The interrupt operation may not work correctly if the comparison operation is started immediately after changing the current value from the program. (The comparison operation will automatically return to the first target value once an interrupt has been generated for the last target value. Repetitious operation is thus possible merely by changing the current value.)

CQM1 Interrupt Functions

Wiring

PC Setup

Depending on the count mode, the input signals from the pulse encoder to the CPU Unit's input terminal are as shown below.

Terminal no.	Up/Down Mode	Incrementing Mode
4	Encoder A-phase	Pulse count input
5	Encoder B-phase	
6	Encoder Z-phase	Reset input

If only the software reset is to be used, terminal 6 can be used as an ordinary input. When in Incrementing Mode, terminal 5 can be used as an ordinary input.

When using high-speed counter 0 interrupts, make the settings in PROGRAM mode shown below before executing the program.

Input Refresh Word Settings (DM 6638)

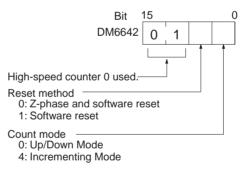

Make these settings when it is necessary to refresh inputs. The setting is the same as that for interval timer 2.

Default: No input refresh

High-speed Counter 0 Settings (DM 6642)

If these settings are not made, high-speed counter 0 cannot be used in the program.

Default: High-speed counter 0 not used.

Changes in the setting in DM 6642 are effective only when power is turned on or PC program execution is started.

Programming

Use the following steps to program high-speed counter 0.

High-speed counter 0 begins the counting operation when the proper PC Setup settings are made, but comparisons will not be made with the comparison table and interrupts will not be generated unless the CTBL(63) instruction is executed.

High-speed counter 0 is reset to "0" when power is turned ON and when operation begins.

The present value of high-speed counter 0 is maintained in SR 230 and SR 231.

Controlling High-speed Counter 0 Interrupts

1,2,3... 1. Use the CTBL(63) instruction to save the comparison table in the CQM1 and begin comparisons.

 (@)CTBL(63)		
P C TB	C: (3 digits BCD) 000: Target table set and comparison begun 001: Range table set and comparison begun 002: Target table set only 003: Range table set only	
	TB: Beginning word of comparison table	

If C is set to 000, then comparisons will be made by the target matching method; if 001, then they will be made by the range comparison method. The comparison table will be saved, and, when the save operation is complete, then comparisons will begin. While comparisons are being executed, high-speed interrupts will be executed according to the comparison table. For details on the contents of the comparison tables that are saved, refer to the explanation of the CTBL(63) instruction in *SECTION 5 Instruction Set*.

Note The comparison results are normally stored in AR 1100 through AR 1107 while the range comparison is being executed.

If C is set to 002, then comparisons will be made by the target matching method; if 003, then they will be made by the range comparison method. For either of these settings, the comparison table will be saved, but comparisons will not begin, and the INI(61) instruction must be used to begin comparisons.

2. To stop comparisons, execute the INI(61) instruction as shown below.

 (@)INI(61)	
	000
	001
	000

To start comparisons again, set the second operand to "000" (execute comparison), and execute the INI(61) instruction.

Once a table has been saved, it will be retained in the CQM1 during operation (i.e., during program execution) as long as no other table is saved.

Reading the PV

There are two ways to read the PV. The first is to read it from SR 230 and SR 231, and the second to use the PRV(62) instruction.

Reading SR 230 and SR 231

The PV of high-speed counter 0 is stored in SR 230 and SR 231 as shown below. The leftmost bit will be F for negative values.

Leftmost 4 digits	Rightmost 4 digits	Up/Down Mode	Incrementing Mode
SR 231	SR 230	F0032767 to 00032767 (–32767)	00000000 to 00065535

Note These words are refreshed only once every cycle, so there may be a difference from the actual PV.

When high-speed counter 0 is not being used, the bits in these words can be used as work bits.

Using the PRV(62) Instruction

Read the PV of high-speed counter 0 by using the PRV(62) instruction.

 (@)PRV(62)	
	000
	000
	P

P1: Leading word of PV

The PV of high-speed counter 0 is stored as shown below. The leftmost bit will be F for negative values.

Leftmost 4 digits	Rightmost 4 digits	Up/Down Mode	Incrementing Mode
P1+1	P1	F0032767 to 00032767 (-32767)	00000000 to 00065535

The PV is read when the PRV(62) instruction is actually executed.

Changing the PV

H

There are two ways to change the PV of high-speed counter 0. The first way is to reset it by using the reset methods. (In this case the PV is reset to 0.) The second way is to use the INI(61) instruction.

The method using the INI(61) instruction is explained here. For an explanation of the reset method, refer to the beginning of this description of high-speed counter 0.

Change the timer PV by using the INI(61) instruction as shown below.

 (@)INI(61)	
	000
	002
	D

D: Leading word for storing PV change data

L	_eftmost 4 digits	Rightmost 4 digits	Up/Down Mode	Incrementing Mode
	D+1	D	F0032767 to 00032767	00000000 to 00065535

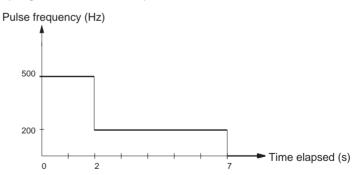

To specify a negative number, set F in the leftmost digit.

Operation Example This example shows a program for using high-speed counter 0 in the Incrementing Mode, making comparisons by means of the target matching method, and changing the frequency of pulse outputs according to the counter's PV. Before executing the program, set the PC Setup as follows:

> DM 6642: 0114 (High-speed counter 0 used with software reset and Incrementing Mode). For all other PC Setup, use the default settings. (Inputs are not refreshed at the time of interrupt processing, and pulse outputs are executed for IR 100.)

	In addition, th	ne followin	g data is stored for the comparison table:
	DM 0000	0002	Number of comparison conditions: 2
	DM 0001 DM 0002	1000 0000	Target value 1: 1000
	DM 0002	0101	Comparison 1 interrupt processing routine no.: 101
	DM 0004	2000	Target value 1: 2000
	DM 0005	0000	
	DM 0006	0102	Comparison 2 interrupt processing routine no.: 102
25315 (ON for 1 scan)	CTBL(63)		
	000		comparison table in target matching format,
	000	and begins	s comparing.
	DM 0000		
	SPED(64)		
	020	Begins co	ntinuous pulse output to IR10002 at 500 Hz.
Ť	#0050		
	SBN(92) 101		
25313 (Always ON)			
	SPED(64) 020	When the	high-speed counter value reaches 1000, subroutine
	020	101 is call 200 Hz.	ed and the frequency of the pulse output is changed to
	#0020	200 112.	
L	RET(93)		
	SBN(92) 102		
25313 (Always ON)			
	SPED(64) 020	When the	high-speed counter value reaches 2000, subroutine 102
	001	to 0.	nd the pulse output is stopped by setting the frequency
	#0000		
+	RET(93)		

When the program is executed, operation will be as follows:

1-5-6 High-speed Counter 0 Overflows/Underflows

If the allowable counting range for high-speed counter 0 is exceeded, and underflow or overflow status will occur and the counter's PV will remain at 0FFF FFFF for overflows and FFFF FFFF for underflows until the overflow/ underflow status is cleared by resetting the counter. The allowable counting ranges are as follows:

Up/Down Mode:	F003 2767 to 0003 2767
Incrementing Mode:	0000 0000 to 0006 5535

Note	1. The values given above are theoretical and assume a reasonably short cy- cle time. The values will actually be those that existed one cycle before the overflow/underflow existed.
	2. The 6th and 7th digits of high-speed counter 0's PV are normally 00, but can be used as "Overflow/Underflow Flags" by detecting values beyond the allowable counting ranges.
	High-speed counter 0 can be reset as described in the previous section or it can be reset automatically by restarting program execution. High-speed counter 0 and related operations will not function normally until the overflow/ underflow status is cleared. Operations during overflow/underflow status will be as follows.
	 Comparison table operation will stop.
	 The comparison table will not be cleared.
	 Interrupt routines for the high-speed counter will not be executed.
	 CTBL(63) can be used only to register the comparison table. If an attempt is made to start comparison table operation, operation will not start and the comparison table will not be registered.
	 INI(61) cannot be used to start or stop comparison table operation or to change the present value.
	 PRV(62) will read out only 0FFF FFFF or FFFF FFFF as the present value.
Recovery	Use the following procedure to recover from overflow/underflow status. With Comparison Table Registered
1,2,3	1. Reset the counter.
	2. Set the PV with PRV(62) if necessary.
	3. Set the comparison table with CTBL(63) if necessary
	4. Start comparison table operation with INI(61).
	Without Comparison Table Registered
1,2,3	1. Reset the counter.
	2. Set the PV with PRV(62) if necessary.
	3. Set the comparison table and start operation with CTBL(63) and INI(61).
Note	The range comparison results in AR 11 will remain after recovery. The inter- rupt routine for a interrupt condition meet immediately after recovery will not be executed if the interrupt condition was already met before the overflow/ underflow status occurred. If interrupt routine execution is necessary, clear AR 11 before proceeding.
Reset Operation	When high-speed counter 0 is reset, the PV will be set to 0, counting will begin from 0, and the comparison table, execution status, and execution results will be maintained.
Startup Counter Status	When high-speed counter 0 is started, the counter mode in the PC Setup will be read and used, the PV will be set to 0, overflow/underflow status will be cleared, the comparison table registration and execution status will be cleared, and range execution results will be cleared. (Range execution results are always cleared when operation is begun or when the comparison table is registered.)
Stopped Counter Status	When high-speed counter 0 is stopped, the PV will be maintained, the com- parison table registration and execution status will be cleared, and range exe-

cution results will be maintained.

1-5-7 High-speed Counter 1 and 2 Interrupts (CQM1-CPU43-EV1)

Pulse signals from a pulse encoder to ports 1 and 2 of the CQM1-CPU43-EV1 can be counted at high speed, and interrupt processing can be executed according to the count.

The 2 ports can be operated separately. The counter for port 1 is called high-speed counter 1 and the counter for port 2 is called high-speed counter 2. This section describes how to use high-speed counters 1 and 2. Refer to the *CQM1 Operation Manual* for hardware information such as equipment and wiring specifications.

- Note 1. High-speed counters 1 and 2 can be used with the CQM1-CPU43-E/-EV1 only.
 - 2. Some instructions cannot be used when the PC Setup (DM 6611) is set to high-speed counter mode.

DM 6611 setting	Affected instructions
High-speed counter mode (0000)	PLS2(—) and mode 0 of ACC(—) cannot be used.
Pulse output mode (0001)	CTBL(63) cannot be used with ports 1 and 2.

Processing

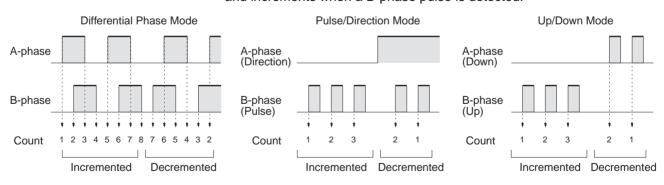

Input Signals and Count Modes

Three types of signals can be input to ports 1 and 2. The count modes used for high-speed counters 1 and 2 are set in DM 6643 and DM 6644 respectively.

1,2,3... 1. Differential Phase Mode (Counting Rate = 25 kHz):

A phase-difference 4X two-phase signal (A-phase and B-phase) and a Zphase signal are used for inputs. The count is incremented or decremented according to differences in the 2-phase signals. This mode is identical to high-speed counter 0's up/down mode.

- Pulse/Direction Mode (Counting Rate = 50 kHz): The A-phase is the direction signal and the B-phase is the count pulse. The counter increments when the A-phase signal is OFF and decrements when it is ON.
- Up/Down Mode (Counting Rate = 50 kHz): The A-phase is the decrementing signal and the B-phase is the incrementing signal. The counter decrements when an A-phase pulse is detected and increments when a B-phase pulse is detected.

Counting Modes

The counting modes (ring mode or linear mode) for high-speed counters 1 and 2 are specified in DM 6643 and DM 6644 respectively.

1,2,3... 1. Ring Mode:

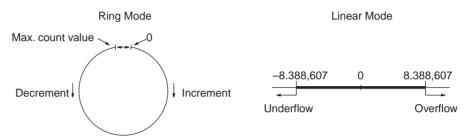

In ring mode, the maximum count value +1 is set in CTBL(63). The counter will go from the maximum count value to 0 when incrementing, and from 0

to the maximum count value when decrementing. There are no negative values.

The number of points on the ring (maximum count value +1) can be set from 1 to 65,000.

2. Linear Mode:

The counting range in linear mode is -8,388,607 to 8,388,607. If the allowable counting range for high-speed counter 1 or 2 is exceeded, an underflow or overflow status will occur and the counter's PV will remain at 0838 8607 for overflows and F838 8607 for underflows, counting or comparison will be stopped, and AR 0509 (port 1) or AR 0609 (port 2) will be turned ON.

- Note
 One of the methods in the following section should always be used to reset the counter when restarting it. The counter will be automatically reset when program execution is started or stopped.
 - The following signal transitions are handled as forward (incrementing) pulses: A-phase leading edge to B-phase leading edge to A-phase trailing edge to B-phase trailing edge. The following signal transitions are handled as reverse (decrementing) pulses: B-phase leading edge to A-phase leading edge to B-phase trailing edge to A-phase trailing edge.

Reset Methods

Either the Z-phase signal + software reset or software reset may be selected for resetting the PV of the count (i.e., setting it to 0). These resets operate the same as they do for high-speed counter 0. Refer to page 48 for details.

- Note 1. The reset bits for high-speed counters 1 and 2 (SR 25201 and SR 25202) are refreshed once every cycle. Make sure that a reset bit is ON for at least one full cycle so it can be read reliably.
 - 2. The comparison table, execution status, and range comparison results will be retained through a reset. (A comparison will be continued after a reset is performed.)

High-speed Counter Interrupt Count

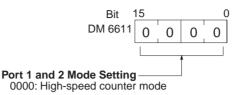

The comparison tables used for high-speed counters 1 and 2 are just like the one used for high-speed counter 0. Refer to page 49 for details.

PC Setup When using high-speed counter 1 and/or 2 interrupts, make the settings in PROGRAM mode shown below before executing the program.

Port 1 and 2 Mode Setting (DM 6611)

Specify high-speed counter mode for ports 1 and 2. If high-speed counter mode is not specified, CTBL(63) cannot be used to make count comparisons.

This setting is read when the PC is turned ON. If it is changed, the PC must be turned off and then on again before executing the program.

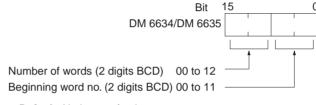

Default: The default mode setting is high-speed counter mode.

Note If DM 6611 is set to pulse output mode, another comparison instruction such as BCMP(68) can be used to compare the PV of high-speed counters 1 and 2.

Input Refresh Word Settings (DM 6634 and DM 6635)

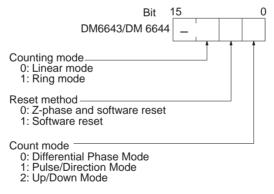

DM 6634 contains the input refresh word settings for high-speed counter 1, and DM 6635 contains the settings for high-speed counter 2. Make these settings when it is necessary to refresh inputs.

Default: No input refresh

High-speed Counter 1 and 2 Settings (DM 6643 and DM 6644)

DM 6643 contains the settings for high-speed counter 1, and DM 6644 contains the settings for high-speed counter 2. These settings determine the operating parameters for these high-speed counters.

Defaults: Linear Mode, Z-phase and software reset, Differential Phase Mode

Programming

Use the following steps to program high-speed counters 1 and 2.

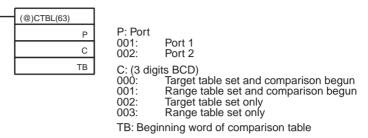

High-speed counters 1 and 2 begin counting when the proper PC Setup settings are made, but comparisons will not be made with the comparison table and interrupts will not be generated unless the CTBL(63) instruction is executed.

High-speed counters 1 and 2 are reset to "0" when power is turned ON, when operation begins, and when operation stops.

The present value of high-speed counter 1 is maintained in SR 232 and SR 233 and the present value of high-speed counter 2 is maintained in SR 234 and SR 235.

Controlling High-speed Counter 1 and 2 Interrupts

1,2,3... 1. Use the CTBL(63) instruction to save the comparison table in the CQM1 and begin comparisons.

If C is set to 000, then comparisons will be made by the target matching method; if 001, then they will be made by the range comparison method. The comparison table will be saved, and, when the save operation is complete, then comparisons will begin. While comparisons are being executed, high-speed interrupts will be executed according to the comparison table. For details on the contents of the comparison tables that are saved, refer to the explanation of the CTBL(63) instruction in *SECTION 5 Instruction Set*.

Note The comparison results are normally stored in AR 1100 through AR 1107 while the range comparison is being executed.

If C is set to 002, then comparisons will be made by the target matching method; if 003, then they will be made by the range comparison method. For either of these settings, the comparison table will be saved, but comparisons will not begin, and the INI(61) instruction must be used to begin comparisons.

 To stop comparisons, execute the INI(61) instruction as shown below. Specify port 1 or 2 in P (P=001 or 002).

_	(@)INI(61)	
		Р
		001
		000

To start comparisons again, set the second operand to "000" (execute comparison), and execute the INI(61) instruction.

Once a table has been saved, it will be retained in the CQM1 during operation (i.e., during program execution) as long as no other table is saved.

Reading the PV

There are two ways to read the PV. The first is to read it from SR 232 and SR 233 (port 1) or SR 234 and SR 235 (port 2), and the second is to use PRV(62).

Reading SR 232 and SR 233 or SR 234 and SR 235

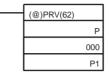

The PV of high-speed counter 1 is stored in SR 232 and SR 233, and the PV of high-speed counter 2 is stored in SR 234 and SR 235 as shown below. In linear mode, the leftmost digit will be F for negative values.

Leftr	nost 4 digits	Rightmost 4 digits	Linear Mode	Ring Mode
Port 1:	SR 233	SR 232	F8388607 to 08388607 (-8,388,607 to 8,388,607)	00000000 to 00064999
Port 2:	SR 235	SR 234	(0,000,007 10 0,000,007)	

Note These words are refreshed only once every cycle, so there may be a difference from the actual PV.

Using the PRV(62) Instruction

Read the PV of high-speed counter 0 by using the PRV(62) instruction. Specify high-speed counter 1 or 2 in P (P=001 or 002).

P: Port (001: port 1; 002: port 2) P1: Leading word of PV

The PV of the specified high-speed counter is stored as shown below. In linear mode, the leftmost bit will be F for negative values.

Leftmost 4 digits	Rightmost 4 digits	Linear Mode	Ring Mode
D+1	D	F8388607 to 08388607 (-8,388,607 to 8,388,607)	00000000 to 00064999

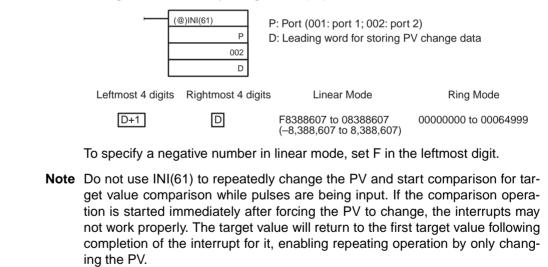

The PV is read when the PRV(62) instruction is actually executed.

Changing the PV

There are two ways to change the PV of high-speed counters 1 and 2. The first way is to reset it by using the reset methods. (In this case the PV is reset to 0.) The second way is to use the INI(61) instruction.

The method using the INI(61) instruction is explained here. For an explanation of the reset method, refer to the beginning of this description of high-speed counters 1 and 2.

Change the timer PV by using the INI(61) instruction as shown below.

High-speed CounterThe status of high-speed counters 1 and 2 can be determined either by read-
ing the status of the relevant flags in the AR area or executing PRV(62).

Word	Bit(s)	Function
AR 04	08 to	Indicates high-speed counter status.
	15	00: Normal 01 or 02: Hardware error 03: PC Setup error
AR 05	00 to 07	High-speed Counter 1 Comparison Result flag for ranges 1 to 8. (0: Not in range; 1: In range)
	08	High-speed Counter 1 Comparison flag (0: Stopped; 1: Comparing)
	09	High-speed Counter 1 Overflow/Underflow flag (0: Normal; 1: Underflow or overflow occurred)
AR 06	00 to 07	High-speed Counter 2 Comparison Result flag for ranges 1 to 8. (0: Not in range; 1: In range)
	08	High-speed Counter 2 Comparison flag (0: Stopped; 1: Comparing)
	09	High-speed Counter 2 Overflow/Underflow flag (0: Normal; 1: Underflow or overflow occurred)

The following table shows the relevant AR area flags and their functions.

The status of high-speed counters 1 and 2 can also be determined by executing PRV(62). Specify high-speed counter 1 or 2 (P=001 to 002) and the destination word D. The status information will be written to bits 00 and 01 of D. Bits 02 to 15 will be set to 0.

Bits 00 and 01 of D contain the specified high-speed counter's status.

Bit	Function
00	Comparison flag (0: Stopped; 1: Comparing)
01	Overflow/Underflow flag (0: Normal; 1: Underflow or overflow occurred)

Operation Example

This example shows a program that outputs standard pulses from port 1 while counting those pulses with high-speed counter 1. The high-speed counter operates in Up/Down Mode, with the pulse output's CW pulses incrementing the counter (B-phase input) and the CCW pulses decrementing the counter (A-phase input). Before executing the program, set the PC Setup as follows and restart the PC.

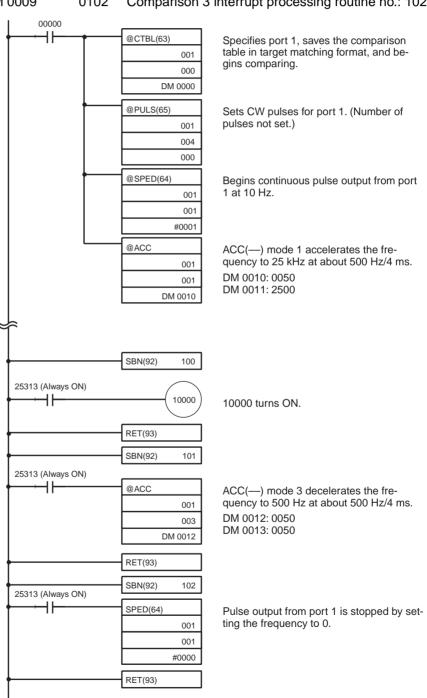

DM 6611: 0000 (High-speed counter mode).

DM 6643: 0002 (Port 1: Standard pulse output, linear counting mode, Z-phase signal with software reset, and Up/Down Mode).

Other PC Setup settings use the default settings. (Inputs are not refreshed at the time of interrupt processing.)

In addition, the following data is stored for the comparison table:

······································				
DM 0000	0003	Number of comparison conditions: 3		
DM 0001	2500	Target value 1: 2,500		
DM 0002	0000			
DM 0003	0100	Comparison 1 interrupt processing routine no.: 100		
DM 0004	7500	Target value 2: 7,500		
DM 0005	0000			
DM 0006	0101	Comparison 2 interrupt processing routine no.: 101		
DM 0007	0000	Target value 2: 10,000		
DM 0008	0001			
DM 0009	0102	Comparison 3 interrupt processing routine no.: 102		

1-5-8 Absolute High-speed Counter Interrupts (CQM1-CPU44-EV1)

Binary-code signals from an absolute rotary encoder can be input to ports 1 and 2 of the CQM1-CPU44-EV1 and counted at 4 kHz. Interrupt processing can be executed according to the count.

The 2 ports can be operated separately. The counter for port 1 is called absolute high-speed counter 1 and the counter for port 2 is called absolute high-speed counter 2. This section describes how to use absolute high-speed counters 1 and 2. Refer to the *CQM1 Operation Manual* for hardware information such as equipment and wiring specifications.

Processing Input Signals and Count Modes

There are two count modes that can be used for absolute high-speed counters 1 and 2. The count mode and the resolution settings are specified in the PC Setup (DM 6643 and DM 6644).

1,2,3... 1. BCD Mode:

The absolute rotary encoder's binary code is first converted to normal binary data and then converted to BCD.

2. 360° Mode:

The absolute rotary encoder's binary code is converted to an angular value (0° to 359°) according to the resolution setting. (CTBL(63) settings are made in 5° units.)

The following table shows the possible counter PVs in BCD mode and 360° mode for each resolution setting.

Resolution	Possible PVs				
	BCD mode	360° mode			
8-bit	0 to 255	PV output: 0° to 359° (1° units)			
10-bit	0 to 1023	Comparison table settings: 0° to 355° (5° units)			
12-bit	0 to 4095				

Absolute High-speed Counter Interrupt Count

The counter's PV can be compared to up to 16 target values or 8 ranges. Refer to 5-15-6 REGISTER COMPARISON TABLE – CTBL(63) for a description of the comparison tables used with absolute high-speed counters 1 and 2.

PC Setup

When using absolute high-speed counter 1 and/or 2 interrupts, make the settings in PROGRAM mode shown below before executing the program.

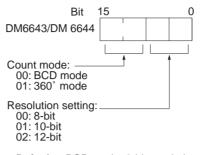

Input Refresh Word Settings (DM 6634 and DM 6635)

DM 6634 contains the input refresh word settings for absolute high-speed counter 1, and DM 6635 contains the settings for absolute high-speed counter 2. Make these settings when it is necessary to refresh inputs.

Absolute High-speed Counter Settings (DM 6643 and DM 6644)

DM 6643 contains the settings for absolute high-speed counter 1, and DM 6644 contains the settings for absolute high-speed counter 2. These words determine the count modes and resolution settings.

Defaults: BCD mode, 8-bit resolution

Origin Compensation It is possible to compensate for an offset between an absolute rotary encoder's origin and the actual origin. This adjustment can be made separately for ports 1 and 2.

Follow the procedure below to set origin compensation. After origin compensation has been set, the data from the encoder will be adjusted before being output as the PV.

- *1,2,3...* 1. Set the absolute rotary encoder to the desired origin location.
 - 2. Make sure that pin 1 of the CPU Unit's DIP switch is OFF (enabling Peripheral Devices to overwrite DM 6614 through DM 6655) and switch the PC to PROGRAM mode.
 - 3. Set the resolution setting in DM 6643 or DM 6644.
 - 4. Make sure that a fatal error or FALS 9C error have not occurred.
 - 5. Read the high-speed counter's PV from IR 232 and IR 233 (port 1) or IR 234 and IR 235 (port 2) to determine the PV before origin compensation.
 - 6. Turn ON the Port 1 Origin Compensation flag (SR 25201) or Port 2 Origin Compensation flag (SR 25202) from a Peripheral Device.

The compensation value will be written to DM 6611 (port 1) or DM 6612 (port 2) and the Origin Compensation flag will be turned OFF automatically. The compensation value will be recorded in BCD between 0000 and 4095 whether the counter is set to BCD mode or 360° mode.

7. Read the high-speed counter's PV to determine the PV after origin compensation. The PV should be 0000 after origin compensation.

The compensation value will be valid until it is changed again by the procedure above.

Programming

Use the following steps to program absolute high-speed counters 1 and 2.

Absolute high-speed counters 1 and 2 begin counting when the proper PC Setup settings are made, but comparisons will not be made with the comparison table and interrupts will not be generated unless the CTBL(63) instruction is executed.

The present value of absolute high-speed counter 1 is maintained in IR 232 and IR 233 and the present value of absolute high-speed counter 2 is maintained in IR 234 and IR 235.

Controlling Absolute High-speed Counter Interrupts

1,2,3... 1. Use the CTBL(63) instruction to save the comparison table in the CQM1 and begin comparisons.

 (@)CTBL(63)	P: Port specifier (001: Port 1; 002: Port 2)		
Р	C: (3 digits BCD)		
С	000: Target table set and comparison begun 001: Range table set and comparison begun		
ТВ	002: Target table set only 003: Range table set only		
	TB: Beginning word of comparison table		

P specifies the port. Set P=001 to specify absolute high-speed counter 1, or P=002 to specify absolute high-speed counter 2.

If C is set to 000, then comparisons will be made by the target matching method; if 001, then they will be made by the range comparison method. The comparison table will be saved, and, when the save operation is complete, then comparisons will begin. While comparisons are being executed, high-speed interrupts will be executed according to the comparison table. Refer to 5-15-6 REGISTER COMPARISON TABLE – CTBL(63) for details on the structure of the comparison tables.

Note The comparison results are normally stored in AR 0500 through AR 0507 (port 1) and AR 0600 through AR 0607 (port 2) while the range comparison is being executed.

If C is set to 002, then comparisons will be made by the target matching method; if 003, then they will be made by the range comparison method. For either of these settings, the comparison table will be saved, but comparisons will not begin, and the INI(61) instruction must be used to begin comparisons.

2. To stop comparisons, execute the INI(61) instruction as shown below. Specify port 1 or 2 in P (P=001 or 002).

 (@)INI(61)	
	Р
	001
	000

To start comparisons again, set the second operand to "000" (execute comparison), and execute the INI(61) instruction.

Once a table has been saved, it will be retained in the CQM1 during operation (i.e., during program execution) as long as no other table is saved.

Reading the PV

There are two ways to read the PV. The first is to read it from IR 232 and IR 233 (port 1) or IR 234 and IR 235 (port 2), and the second is to use PRV(62).

Reading IR 232 and IR 233 or IR 234 and IR 235

The PV of absolute high-speed counter 1 is stored in IR 232 and IR 233, and the PV of absolute high-speed counter 2 is stored in IR 234 and IR 235 as shown below.

 Leftmost 4 digits
 Rightmost 4 digits
 BCD Mode
 360° Mode

 Port 1:
 IR 233
 IR 232
 0000 0000 to 0000 4095
 0000 0000 to 0000 0359

 Port 2:
 IR 235
 IR 234
 0000 0000 to 0000 4095
 0000 0000 to 0000 0359

Note These words are refreshed only once every cycle, so there may be a difference from the actual PV.

Using the PRV(62) Instruction

D+1

Read the PV of an absolute high-speed counter by using the PRV(62) instruction. Specify absolute high-speed counter 1 or 2 in P (P=001 or 002).

P: Port (001: port 1; 002: port 2) P1: Leading word of PV

The PV of the specified absolute high-speed counter is stored as shown below.

Leftmost 4 digits Rightmost 4 digits BCD Mode 360° Mode

D 0000 0000 to 0000 4095 0000 to 0000 to 0000 0359

The PV is read when the PRV(62) instruction is actually executed.

The status of absolute high-speed counters 1 and 2 can be determined either by reading the status of the relevant flags in the AR area or executing PRV(62).

The following table shows the relevant AR area flags and their functions.

Word	Bit(s)	Function
AR 04	08 to	Indicates absolute high-speed counter status.
	15	00: normal 01 or 02: Hardware error 03: PC Setup error
AR 05	00 to 07	Counter 1 Comparison Result flags for ranges 1 to 8. (0: Not in range; 1: In range)
	08	Counter 1 Comparison flag (0: Stopped; 1: Comparing)
AR 06	0600 to 07Counter 2 Comparison Result flags for ranges 1 to 8. (0: Not in range; 1: In range)	
	08	Counter 2 Comparison flag (0: Stopped; 1: Comparing)

The comparison flag status of absolute high-speed counters 1 and 2 can also be determined by executing PRV(62). Specify absolute high-speed counter 1 or 2 (P=001 to 002) and the destination word D. The flag status (0: Stopped; 1: Comparing) will be written to bit 00 of D. Bits 01 to 15 will be set to 0.

Execution condition	
	@PRV(62)
	Р
	001
[D

Operation Example

This example shows a program that receives an input signal from an absolute rotary encoder at port 1 and uses this input to control outputs IR 10000 through IR 10003. Absolute high-speed counter 1 is set for 8-bit resolution and 360° Mode, and range comparisons are used. Before executing the program, set DM 6643 to 0100 (Port 1: 360° Mode, 8-bit resolution).

Other PC Setup settings use the default settings. (Inputs are not refreshed at the time of interrupt processing.)

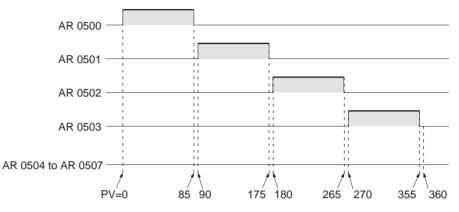

In addition, the following data is stored for the comparison table:

Reading Absolute High-speed Counter Status

Section 1-5

DM 0000	0000	Lower limit #1 (0°)	ר[

	(Always ON)	#0004 100 RET(93) SBN(92) 103 MOV(21)	Turns ON 10002. Turns other bits in IR 100 OFF. Turns ON 10003. Turns other bits in IR 100 OFF.

The following diagram shows the relationship between absolute high-speed counter 1's PV and Range Comparison Result flags AR 0500 to AR 0507 as the above program is executed.

1-6 CPM1/CPM1A Interrupt Functions

This section explains the settings and methods for using the CPM1/CPM1A interrupt functions.

1-6-1 Types of Interrupts

		Inp	e CPM1/CPM1A has three types of interrupt processing, as outlined below. but Interrupts
		exe	M1/CPM1A PCs have two or four interrupt inputs. Interrupt processing is ecuted when one of these inputs is turned ON from an external source. erval Timer Interrupts
			errupt processing is executed by an interval timer with a precision of 0.1
		Hig	Jh-speed Counter Interrupts
		000	e high-speed counter counts pulse inputs to one of CPU bits 00000 to 002. Interrupt processing is executed when the count reaches the set value a built-in high-speed counter.
Interrupt Priority			en an interrupt is generated, the specified interrupt processing routine is ecuted. Interrupts have the following priority ranking. Input interrupts > Interval interrupts = High-speed counter interrupts
		ing be	en an interrupt with a higher priority is received during interrupt process- , the current processes will be stopped and the newly received interrupt will processed instead. After that routine has been completely executed, then cessing of the previous interrupt will be resumed.
		pro rou	en an interrupt with a lower or equal priority is received during interrupt cessing, then the newly received interrupt will be processed as soon as the tine currently being processed has been completely executed.
			en two interrupts with equal priority are received at the same time, they are ecuted in the following order:
			Input interrupt 0 > Input interrupt 1 > Input interrupt 2 > Input interrupt 3 Interval interrupts > High-speed counter interrupts
Interrupt Program Precautions		Ob	serve the following precautions when using interrupt programs:
	1,2,3	1.	A new interrupt can be defined within an interrupt program. Furthermore, an interrupt can be cleared from within an interrupt program.
		2.	Another interrupt program cannot be written within an interrupt program.
		3.	A subroutine program cannot be written within an interrupt program. Do not write a SUBROUTINE DEFINE instruction, SBN(92), within an interrupt program.

4. An interrupt program cannot be written within a subroutine program. Do not write an interrupt program between a SUBROUTINE DEFINE instruction (SBN(92)) and a RETURN instruction (RET(93)).

Inputs used as interrupts cannot be used as regular inputs.

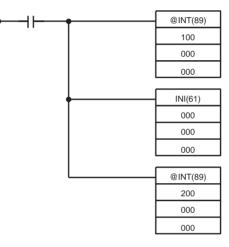

High-speed Counter Instructions and Interrupts The following instructions cannot be executed in an interrupt subroutine when an instruction that controls high-speed counters is being executed in the main program:

INI(61), PRV(62), or CTBL(63)

The following methods can be used to circumvent this limitation:

Method 1

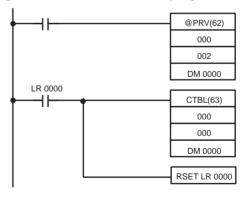

All interrupt processing can be masked while the instruction is being executed.

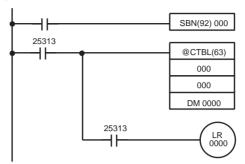

Method 2

Execute the instruction again in the main program.

1,2,3... 1. This is the program section from the main program:

2. This is the program section from the interrupt subroutine:

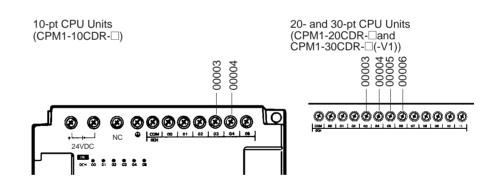

- **Note** 1. Define interrupt routines at the end of the main program with SBN(92) and RET(93) instructions, just like regular subroutines.
 - 2. When defining an interrupt routine, a "SBS UNDEFD" error will occur during the program check operation, but the program will be executed normally.

1-6-2 Input Interrupts

The 10-pt CPU Units (CPM1-10CDR- \Box and CPM1A-10CDR- \Box) have two interrupt inputs (00003 and 00004).

The 20-, 30-, and 40-pt CPU Units (CPM1-20CDR- \Box , CPM1A-20CDR- \Box , CPM1-30CDR- \Box (-V1), CPM1A-30CDR- \Box and CPM1A-40CDR- \Box) have four interrupt inputs (00003 to 00006).

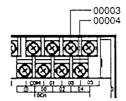

There are two modes for input interrupts: input interrupt mode and counter mode.

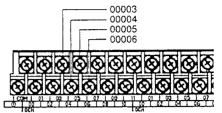

CPM1 PCs

CPM1A PCs

10-pt CPU Units (CPM1A-10CDR-□)

20-, 30-, and 40-pt CPU Units (CPM1A-20CDR-□, CPM1A-30CDR-□, and CPM1A-40CDR-□)

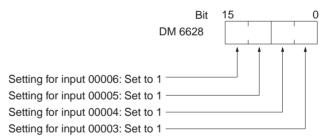

CPU Unit	Input Interrupt		Response time		
		number	Interrupt mode	Counter mode	
CPM1-10CDR-	00003	00	0.3 ms max.	1 kHz	
CPM1A-10CD□-□	00004	01	(Time until the		
CPM1-20CDR-	00003	00	interrupt program is executed.)		
CPM1A-20CD□-□ CPM1-30CDR-□(-V1)		one careary			
CPM1A-30CDC-C	00003	02			
CPM1A-40CD□-□	00004	03			

Note If input interrupts are not used, use inputs 00003 to 00006 as regular inputs.

Input Interrupt Settings

Inputs 00003 to 00006 must be set as interrupt inputs in DM 6628 if they are to be used for input interrupts in the CPM1/CPM1A. Set the corresponding digit to 1 if the input is to be used as an interrupt input (input interrupt or counter mode); set it to 0 if it is to be used as a regular input.

Word	Setting		
DM 6628	0: Regular input (default setting) 1: Interrupt input 2: Quick-response input		

Interrupt Subroutines

Interrupts from inputs 00003 to 00006 are allocated interrupt numbers 00 to 03 and call subroutines 000 to 003. If the input interrupts aren't being used, subroutines 000 to 003 can be used in regular subroutines.

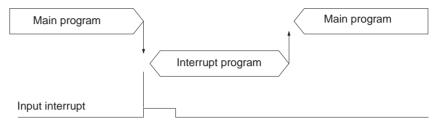

Input number	Interrupt number	Subroutine number
00003	0	000
00004	1	001
00005	2	002
00006	3	003

Input Refreshing

If input refreshing is not used, input signal status within the interrupt routine will not be reliable. Depending on the input time constant, the input signals might not go ON even if input refreshing is used. This includes the status of the interrupt input bit that activated the interrupt.

For example, IR 00000 would not be ON in interrupt routine for input interrupt 0 unless it was refreshed. In this case, use the Always ON Flag, SR 25313 in the interrupt routine instead of IR 00000.

Input Interrupt Mode When an input interrupt signal is received, the main program is interrupted and the interrupt program is executed immediately, regardless of the point in the cycle in which the interrupt is received. The signal must be ON for 200 μs or more to be detected.

Use the following instructions to program input interrupts using the Input Interrupt Mode.

Masking/Unmasking of Interrupts

With the INT(89) instruction, set or clear input interrupt masks as required.

 (@)INT(89)		
	000	
	000	
	D	

Make the settings with word D bits 0 to 3, which correspond to input interrupts 0 to 3. 0: Mask cleared. (Input interrupt enabled.)

1: Mask set. (Input interrupt disabled.)

All of the input interrupts are masked when PC operation is started. If input interrupt mode is being used, be sure to enable the inputs by executing INT(89) as shown above.

Clearing Masked Interrupts

If the bit corresponding to an input interrupt turns ON while masked, that input interrupt will be saved in memory and will be executed as soon as the mask is cleared. In order for that input interrupt not to be executed when the mask is cleared, the interrupt must be cleared from memory.

Only one interrupt signal will be saved in memory for each interrupt number.

With the INT(89) instruction, clear the input interrupt from memory.

 (@)INT(89)	
	001
	000
	D

H

If D bits 0 to 3, which correspond to input interrupts 0 to 3, are set to "1," then the input interrupts will be cleared from memory.

- 0: Input interrupt retained.
- 1: Input interrupt cleared.

Reading Mask Status

With the INT(89) instruction, read the input interrupt mask status.

 (@)INT(89)		
	002	
	000	
	D	

The status of the rightmost digit of the data stored in word D (bits 0 to 3) show the mask status.

- 0: Mask cleared. (Input interrupt enabled.)
- 1: Mask set. (Input interrupt disabled.)

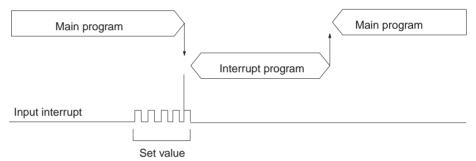

Program Example

When input 00003 (interrupt no. 0) goes ON, operation moves immediately to the interrupt program with subroutine number 000. Inputs for DM 6628 have been set to 0001.

Counter Mode

External signal inputs are counted at high speed and an interrupt is generated when the count reaches the set value. When an interrupt is generated, the main program is interrupted and the interrupt program is executed. Signals up to 1 kHz can be counted.

Use the following steps to program input interrupts using the Counter Mode.

Write the set values for counter operation to the SR words shown in the following table. The set values are written between 0000 and FFFF (0 to 65,535). A value of 0000 will disable the count operation until a new value is set and step 2, below, is repeated.

Interrupt	Word
Input interrupt 0	SR 240
Input interrupt 1	SR 241
Input interrupt 2	SR 242
Input interrupt 3	SR 243

The SR words used in the Counter Mode (SR 240 to SR 243) contain hexadecimal data, not BCD. If the Counter Mode is not used, these words can be used as work bits.

Note These SR words are cleared at the beginning of operation, and must be written from the program.

2. With the INT(89) instruction, refresh the Counter Mode set value and enable interrupts.

 (@)INT(89) 00	If D bits 0 to 3, which correspond to input interrupts 0 to 3, are set to "0," then the set value will be refreshed and inter- rupts will be permitted.
00	0 0: Counter mode set value refreshed and mask cleared.
	D 1: Not refreshed.

Be sure to set the corresponding bit to 1 if an input interrupt isn't being controlled.

The input interrupt for which the set value is refreshed will be enabled in Counter Mode. When the counter reaches the set value, an interrupt will occur, the counter will be reset, and counting/interrupts will continue until the counter is stopped.

- If the INT(89) instruction is used during counting, the present value (PV) will return to the set value (SV). You must, therefore, use the differentiated form of the instruction or an interrupt may never occur.
 - The set value will be set when the INT(89) instruction is executed. If interrupts are already in operation, then the set value will not be changed just by changing the content of SR 240 to SR 243, i.e., if the contents are changed, the set value must be refreshed by executing the INT(89) instruction again.

Interrupts can be masked using the same process used with the Input Interrupt Mode, but if the masked interrupts are cleared using the same process, the interrupts will operate in Input Interrupt Mode, not Counter Mode.

Interrupt signals received for masked interrupts can also be cleared using the same process as for the Input Interrupt Mode.

Counter PV in Counter Mode

When input interrupts are used in Counter Mode, the counter PV will be stored in the SR word corresponding to input interrupts 0 to 3. Values are 0000 to FFFE (0 to 65,534) and will equal the counter PV minus one.

Interrupt	Word
Input interrupt 0	SR 244
Input interrupt 1	SR 245
Input interrupt 2	SR 246
Input interrupt 3	SR 247

Example: The present value for an interrupt whose set value is 000A will be recorded as 0009 immediately after INT(89) is executed.

Note Even if input interrupts are not used in Counter Mode, these SR bits cannot be used as work bits.

Program Example

When input 00003 (interrupt no. 0) goes ON 10 times, operation moves immediately to the interrupt program with subroutine number 000. The following

Interrupt	Word containing SV	Word containing PV-1
Input 00003 (input interrupt 0)	SR 240	SR 244
Input 00004 (input interrupt 1)	SR 241	SR 245
Input 00005 (input interrupt 2)	SR 242	SR 246
Input 00006 (input interrupt 3)	SR 243	SR 247

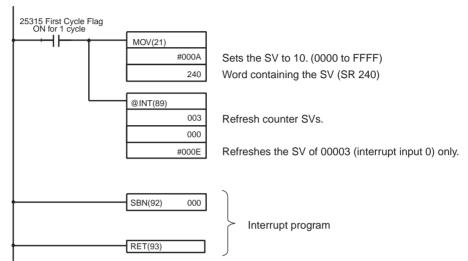

table shows where the counters` set values and present values –1 are stored. Inputs for DM 6628 have been set to 0001.

1-6-3 Masking All Interrupts

All interrupts, including input interrupts, interval timer interrupts, and highspeed counter interrupts, can be masked and unmasked as a group by means of the INT(89) instruction. The mask is in addition to any masks on the individual types of interrupts. Furthermore, clearing the masks for all interrupts does not clear the masks on the individual types of interrupts, but restores them to the masked conditions that existed before INT(89) was executed to mask them as a group.

Do not use INT(89) to mask interrupts unless it is necessary to temporarily mask all interrupts and always use INT(89) instructions in pairs to do so, using the first INT(89) instruction to mask and the second one to unmask interrupts. INT(89) cannot be used to mask and unmask all interrupts from within interrupt routines.

Masking Interrupts

Use the INT(89) instruction to disable all interrupts.

 (@)INT(89)	
	100
	000
	000

If an interrupt is generated while interrupts are masked, interrupt processing will not be executed but the interrupt will be recorded for the input, interval timer, and high-speed counter interrupts. The interrupts will then be serviced as soon as interrupts are unmasked.

75

Unmasking Interrupts Use the INT(89) instruction to unmask interrupts as follows:

1-6-4 Interval Timer Interrupts

The CPM1/CPM1A is equipped with one interval timer. When the interval timer times out, the main program is interrupted and the interrupt program is executed immediately, regardless of the point in the cycle.

(@)INT(89)

200 000 000

There are two modes for interval timer operation, the One-shot Mode, in which only one interrupt will be executed when time expires, and the Scheduled Interrupt Mode in which the interrupt is repeated at a fixed interval.

The interval timer's set value can be set anywhere from 0.5 to 319968 ms, in units of 0.1 ms.

Use the following instruction to activate and control the interval timer.

Starting Up in One-Shot Mode

Use the STIM(69) instruction to start the interval timer in the one-shot mode.

(@)STIM(69)	
(@)51110(69)	
	C_1
	C_2
	C ₃

C1: Interval timer, one-shot mode (000)

C₂: Timer set value (first word address)

C₃: Subroutine no. (4 digits BCD): 0000 to 0049

1,2,3... 1. When C₂ is entered as a word address:

C2: Decrementing counter set value (4 digits BCD): 0000 to 9999

 C_2 + 1: Decrementing time interval (4 digits BCD; unit: 0.1 ms): 0005 to 0320 (0.5 ms to 32 ms)

Each time that the interval specified in word $C_2 + 1$ elapses, the decrementing counter will decrement the present value by one. When the PV reaches 0, the designated subroutine will be called just once and the timer will stop.

The time from when the STIM(69) instruction is executed until time elapses is calculated as follows:

(Content of C₂) × (Content of C₂ + 1) × 0.1 ms = (0.5 to 319,968 ms)

2. When C₂ is entered as a constant:

The set value of the decrementing counter will equal the specified constant (in ms) and the decrementing time interval will be 10 (1 ms).

Starting Up in Scheduled Interrupt Mode

Use the STIM(69) instruction to start the interval timer in the scheduled interrupt mode.

C₁: Interval timer, scheduled interrupt mode (003) C₂: Timer set value (leading word no.) C₃: Subroutine no. (4 digits BCD): 0000 to 0049

1,2,3... 1. When C₂ is entered as a word address:

C₂: Decrementing counter set value (4 digits BCD): 0000 to 9999

 C_2 + 1: Decrementing time interval (4 digits BCD; unit: 0.1 ms): 0005 to 0320 (0.5 ms to 32 ms)

The meanings of the settings are the same as for the one-shot mode, but in the scheduled interrupt mode the timer PV will be reset to the set value

Operation

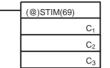

and decrementing will begin again after the subroutine has been called. In the scheduled interrupt mode, interrupts will continue to be repeated at fixed intervals until the operation is stopped.

2. When C₂ is entered as a constant:

The settings are the same as for the one-shot mode, but interrupts will continue to be repeated at fixed intervals until the operation is stopped.

Reading the Timer's Elapsed Time

Use the STIM(69) instruction to read the timer's elapsed time.

C₁: Read elapsed time (006) C₂: Leading word of parameter 1 C₃: Parameter 2

 C_2 : Number of times the decrementing counter has ben decremented (4 digits BCD)

 C_2 + 1: Decrementing counter time interval (4 digits BCD; unit: 0.1 ms) C_3 : Elapsed time from previous decrement (4 digits BCD; unit: 0.1 ms)

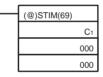

The time from when the interval timer is started until the execution of this instruction is calculated as follows:

{(Content of C2) × (Content of C2+1) + (Content of C3)} × 0.1 ms

If the specified interval timer is stopped, then "0000" will be stored.

Stopping the Timer

Use the STIM(69) instruction to stop the interval timer. The interval timer will be stopped.

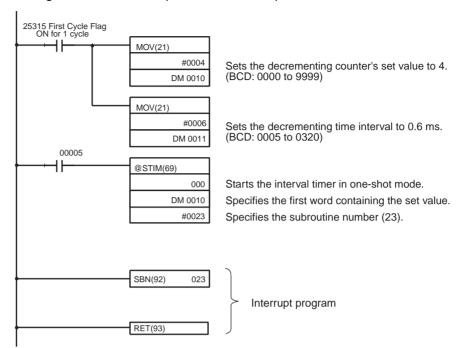

C1: Stop interval timer (010)

Section 1-6

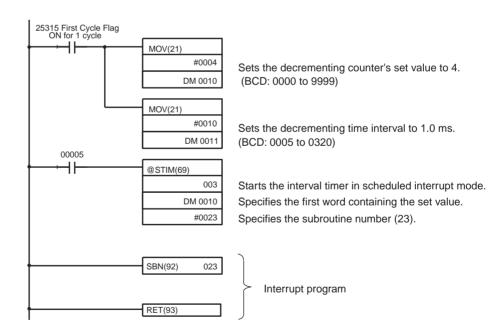

Application Example (One-shot Mode)

In this example, an interrupt is generated 2.4 ms (0.6 ms \times 4) after input 00005 goes ON; the interrupt executes interrupt subroutine number 23.

Application Example (Scheduled Interrupt Mode)

In this example, an interrupt is generated every 4.0 ms (1.0 ms \times 4) after input 00005 goes ON; the interrupts execute interrupt subroutine number 23.

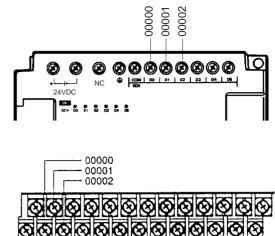

1-6-5 High-speed Counter Interrupts

CPM1/CPM1A PCs have a high-speed counter function that can be used in incrementing mode or up/down mode. The high-speed counter can be combined with input interrupts to perform target value control or zone comparison control that isn't affected by the PC's cycle time.

High-speed counter signals can be input to CPU bits 00000 through 00002.

CPM1/CPM1A Interrupt Functions

CPM1 PCs

Mode	Input functions	Input method	Count frequency	Count range	Control methods	
Up/Down	00000: A-phase input 00001: B-phase input 00002: Z-phase input	Phase-difference, 4× inputs	2.5 kHz max.	-32767 to 32767	Target value control: Up to 16 target values and interrup subroutine numbers can be regis-	
Incrementing	00000: Count input 00001: See note. 00002: Reset input	Individual inputs	5.0 kHz max.	0 to 65535	tered. Zone comparison control: Up to 8 sets of upper limit values, lower limit values, and interrupt subroutine numbers can be regis- tered.	

Note In incrementing mode, input 00001 can be used as a regular input. When the reset method is used for the software reset, input 00002 can be used as a regular input. Also, even when used for the Z-phase signal and software reset, the input status is reflected inn 00002 of the I/O memory.

High-speed Counter Settings

The following settings must be made in DM 6642 when using the CPM1/ CPM1A's high-speed counter function.

DM 6642	Function	Settings		
Bits		Incrementing	Up/Down	Not used
00 to 03	Sets the counter mode: 0: Up/down 4: Incrementing	4	0	0 or 4
04 to 07	Sets the reset method: 0: Z-phase + software reset 1: Software reset	0 or 1	0 or 1	0 or 1
08 to 15	Sets the counter: 00: Counter not being used. 01: Counter being used.	01	01	00

CPM1A PCs

Count Range

The CPM1/CPM1A's high-speed counter uses linear operation and the count (present value) is stored in SR 248 and SR 249. (The upper four digits are stored in SR 249 and the lower four digits are stored in SR 248.)

Mode	Count range
Up/Down	F003 2767 to 0003 2767 (-32,767 to 32,767) The leftmost digit in SR 248 indicates the sign. F is negative, 0 is positive.
Incrementing	0000 0000 to 0006 5535 (0 to 65,535)

An overflow will occur if the count exceeds the upper limit in the count range and an underflow will occur if the count goes below the lower limit in the count range.

Error	Incrementing	Up/Down	Present value
Overflow	Occurs when the count is incremented from 65,535.	Occurs when the count is incremented from 32,767.	0FFF FFFF
Underflow		Occurs when the count is decremented from –32,767.	FFFF FFFF

Processing

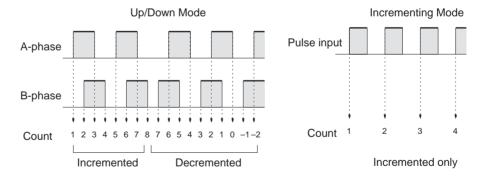

Two types of signals can be input from a pulse encoder. The count mode used for the high-speed counter will depend on the signal type. The count mode and reset mode are set in DM 6642; these settings become effective when the power is turned on or PC operation is started.

Up/Down Mode:

A phase-difference $4 \times$ two-phase signal (A-phase and B-phase) and a Z-phase signal are used for inputs. The count is incremented or decremented according to differences in the 2-phase signals.

Incrementing Mode:

One single-phase pulse signal and a count reset signal are used for inputs. The count is incremented according to the single-phase signal.

Note One of the reset methods described below should always be used to reset the counter when restarting it. The counter will be automatically reset when program execution is started or stopped.

The following signal transitions are handled as forward (incrementing) pulses: A-phase leading edge to B-phase leading edge to A-phase trailing edge to Bphase trailing edge. The following signal transitions are handled as reverse (decrementing) pulses: B-phase leading edge to A-phase leading edge to Bphase trailing edge to A-phase trailing edge.

The Up/Down Mode always uses a $4 \times$ phase-difference input. The number of counts for each encoder revolution would be 4 times the resolution of the counter. Select the encoder based on the countable ranges.

Reset Methods

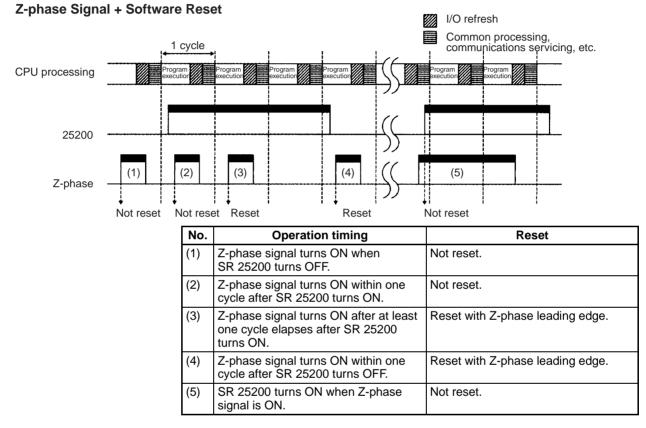

Either of the two methods described below may be selected for resetting the PV of the count (i.e., setting it to 0).

Z-phase signal + software reset:

The PV is reset when the Z-phase signal (reset input) is turned ON while the High-speed Counter Reset Bit (SR 25200) is ON.

Software reset:

The PV is reset when the High-speed Counter Reset Bit (SR 25200) is turned ON.

Note The High-speed Counter Reset Bit (SR 25200) is refreshed once every cycle, so in order for it to be read reliably it must be ON for at least one cycle.

The "Z" in "Z-phase" is an abbreviation for "Zero." It is a signal that shows that the encoder has completed one cycle.

High-speed Counter Interrupt Count

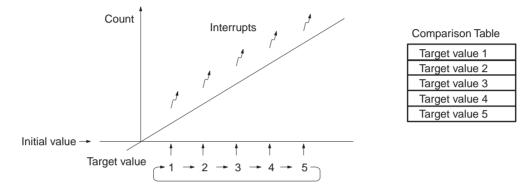

For high-speed counter 0 interrupts, a comparison table is used instead of a "count up." The count check can be carried out by either of the two methods described below. In the comparison table, comparison conditions (for comparing to the PV) and interrupt routine combinations are saved.

Target value:

A maximum of 16 comparison conditions (target values and count directions) and interrupt routine combinations are saved in the comparison table. When the counter PV and the count direction match the comparison conditions, then the specified interrupt routine is executed. Range (zone) comparison:

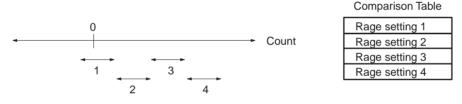

Eight comparison conditions (upper and lower limits) and interrupt routine combinations are saved in the comparison table. When the PV is greater than or equal to the lower limit and less than or equal to the upper limit, then the specified interrupt routine is executed.

Target Value Comparisons The current count is compared to the target values in the order that target values are set in the comparison table and interrupts are generated as the count equals each target value. Once the count has equaled all of the target values in the table, the target value is set to the first target value in the table, which is again compared to the current counted until the two values are equal.

Range Comparisons

The current count is compared in cyclic fashion to all of the ranges at the same time and interrupts are generated based on the results of the comparisons.

Note When performing target value comparisons, do not repeatedly use the INI instruction to change the current value of the count and start the comparison operation. The interrupt operation may not work correctly if the comparison operation is started immediately after changing the current value from the program. (The comparison operation will automatically return to the first target value once an interrupt has been generated for the last target value. Repetitious operation is thus possible merely by changing the current value.)

Programming Use the following steps to program the high-speed counter.

The high-speed counter begins the counting operation when the proper PC Setup settings are made, but comparisons will not be made with the comparison table and interrupts will not be generated unless the CTBL(63) instruction is executed.

The high-speed counter is reset to "0" when power is turned ON and when operation begins.

The present value of high-speed counter is maintained in SR 248 and SR 249.

Controlling High-speed Counter Interrupts

1,2,3... 1. Use the CTBL(63) instruction to save the comparison table in the CPM1/ CPM1A and begin comparisons.

 (@)CTBL(63)	
P	C: (3 digits BCD)
С	000: Target table set and comparison begun 001: Range table set and comparison begun
ТВ	002: Target table set only 003: Range table set only
	TB: Beginning word of comparison table

If C is set to 000, then comparisons will be made by the target matching method; if 001, then they will be made by the range comparison method. The comparison table will be saved, and, when the save operation is complete, then comparisons will begin. While comparisons are being executed, high-speed interrupts will be executed according to the comparison table. For details on the contents of the comparison tables that are saved, refer

to the explanation of the CTBL(63) instruction in *SECTION 5 Instruction Set.* Note The comparison results are normally stored in AR 1100 through

AR 1107 while the range comparison is being executed.

If C is set to 002, then comparisons will be made by the target matching method; if 003, then they will be made by the range comparison method. For either of these settings, the comparison table will be saved, but comparisons will not begin, and the INI(61) instruction must be used to begin comparisons.

2. To stop comparisons, execute the INI(61) instruction as shown below.

_	(@)INI(61)	
		000
		001
		000

To start comparisons again, set the second operand to "000" (execute comparison), and execute the INI(61) instruction.

Once a table has been saved, it will be retained in the CPM1/CPM1A during operation (i.e., during program execution) as long as no other table is saved.

Reading the PV

There are two ways to read the PV. The first is to read it from SR 248 and SR 249, and the second to use the PRV(62) instruction.

Reading SR 248 and SR 249

The PV of high-speed counter is stored in SR 248 and SR 249 as shown below. The leftmost bit will be F for negative values.

Leftmost 4 digits	Rightmost 4 digits	Up/Down Mode	Incrementing Mode
SR 249	SR 248	F0032767 to 00032767 (-32767)	00000000 to 00065535

- **Note** 1. These words are refreshed only once every cycle, so there may be a difference from the actual PV.
 - 2. When high-speed counter is not being used, the bits in these words can be used as work bits.

Using the PRV(62) Instruction

Read the PV of the high-speed counter by using the PRV(62) instruction.

(@)PRV(62)	
	000
	000
	P1

P1: Leading word of PV

The PV of the high-speed counter is stored as shown below. The leftmost bit will be F for negative values.

Leftmost 4 digits	Rightmost 4 digits	Up/Down Mode	Incrementing Mode
P1+1	P1	F0032767 to 00032767 (-32767)	00000000 to 00065535

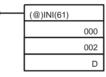

The PV is read when the PRV(62) instruction is actually executed.

Changing the PV

There are two ways to change the PV of high-speed counter. The first way is to reset it by using the reset methods. (In this case the PV is reset to 0.) The second way is to use the INI(61) instruction.

The method using the INI(61) instruction is explained here. For an explanation of the reset method, refer to the beginning of this description of high-speed counter.

Change the timer PV by using the INI(61) instruction as shown below.

D: Leading word for storing PV change data

Leftmos	st 4 digits Rig	ntmost 4 digits	Up/Down Mode	Incrementing Mode
D	+1	D F	F0032767 to 00032767	00000000 to 00065535

To specify a negative number in up/down mode, set F in the leftmost digit.

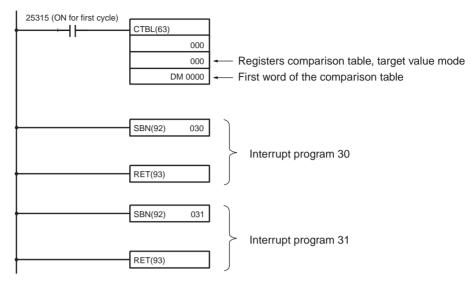

This example shows a program that uses the high-speed counter with singlephase inputs in the Incrementing Mode, making comparisons by means of the target matching method.

The comparison conditions (target values and count directions) are stored in the comparison table with the subroutine numbers. Up to 16 target values can be stored. The corresponding subroutine is executed when the counter's PV matches the target value.

The following data is stored for the comparison table:

DM 0000 DM 0001	0002 1000	Number of comparison conditions: 2 Target value 1: 1000
DM 0002	0000	
DM 0003	0030	Comparison 1 interrupt subroutine no.: 30
DM 0004	2000	Target value 2: 2000
DM 0005	0000	
DM 0006	0031	Comparison 2 interrupt subroutine no.: 31

Application Example (Incrementing Mode) The following diagram shows the example ladder program. DM 6642 must be set to $01\Box 4$, where \Box is the reset method which can be set to 0 or 1.

Application Example (Up/Down Mode)

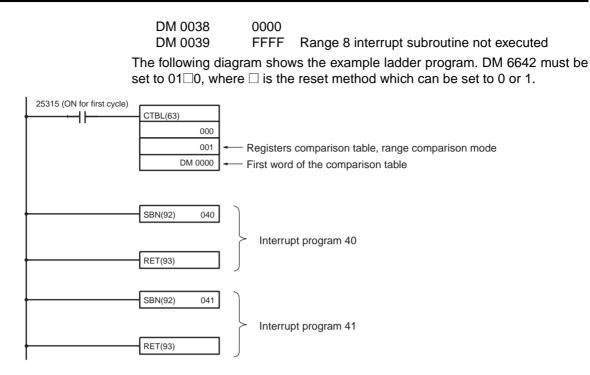

This example shows a program that uses the high-speed counter with phasedifference inputs in the Up/Down Mode, making comparisons by means of the range comparison method.

The comparison conditions (upper/lower limits of the ranges) are stored in the comparison table with the subroutine numbers. Up to 8 separate ranges can be defined. The corresponding subroutine is executed when the counter's PV is within the range.

Note Always set 8 ranges. If fewer than 8 ranges are needed, set the remaining subroutine numbers to FFFF. A value of FFFF indicates that no subroutine is to be executed.

The following data is stored for the comparison table:

0		•
DM 0000	1500	
DM 0001	0000	Lower limit 1: 1,500 counts
DM 0002	3000	
DM 0003	0000	Upper limit 1: 3,000 counts
DM 0004	0040	Range 1 interrupt subroutine no.: 40
DM 0005	7500	
DM 0006	0000	Lower limit 2: 7,500 counts
DM 0007	0000	
DM 0008	0001	Upper limit 2: 10,000 counts
DM 0009	0041	Range 2 interrupt subroutine no.: 41
DM 0010	0000	
DM 0011	0000	
DM 0012	0000	
DM 0013	0000	
DM 0014	FFFF	Range 3 interrupt subroutine not executed
•		
•		
DM 0035	0000	
DM 0036	0000	
DM 0037	0000	

1-7 SRM1 Interrupt Functions

This section explains the settings and methods for using the SRM1 interrupt functions.

1-7-1 Types of Interrupts

The SRM1 has only one type of interrupt processing, as outlined below.

Interval Timer Interrupts

Interrupt processing is executed by an interval timer with a precision of 0.1 ms.

1-7-2 Interval Timer Interrupts

The SRM1 is equipped with one interval timer. When the interval timer times out, the main program is interrupted and the interrupt program is executed immediately, regardless of the point in the cycle.

There are two modes for interval timer operation, the One-shot Mode, in which only one interrupt will be executed when time expires, and the Scheduled Interrupt Mode in which the interrupt is repeated at a fixed interval.

The interval timer's set value can be set anywhere from 0.5 to 319968 ms, in units of 0.1 ms.

Operation Use the following instruction to activate and control the interval timer.

Starting Up in One-Shot Mode

Use the STIM(69) instruction to start the interval timer in the one-shot mode.

 (@)STIM(69)	
(-)- ()	C ₁
	C ₂
	C_3

C₁: Interval timer, one-shot mode (000)

C₂: Timer set value (first word address)

 $C_3\!\!:$ Subroutine no. (4 digits BCD): 0000 to 0049

1,2,3... 1. When C₂ is entered as a word address:

C2: Decrementing counter set value (4 digits BCD): 0000 to 9999

 C_2 + 1: Decrementing time interval (4 digits BCD; unit: 0.1 ms): 0005 to 0320 (0.5 ms to 32 ms)

Each time that the interval specified in word $C_2 + 1$ elapses, the decrementing counter will decrement the present value by one. When the PV reaches 0, the designated subroutine will be called just once and the timer will stop.

The time from when the STIM(69) instruction is executed until time elapses is calculated as follows:

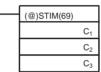

(Content of C_2) × (Content of C_2 + 1) × 0.1 ms = (0.5 to 319,968 ms)

2. When C₂ is entered as a constant:

The set value of the decrementing counter will equal the specified constant (in ms) and the decrementing time interval will be 10 (1 ms).

Starting Up in Scheduled Interrupt Mode

Use the STIM(69) instruction to start the interval timer in the scheduled interrupt mode.

 $\begin{array}{l} C_1: \mbox{ Interval timer, scheduled interrupt mode (003)}\\ C_2: \mbox{ Timer set value (leading word no.)}\\ C_3: \mbox{ Subroutine no. (4 digits BCD): 0000 to 0049} \end{array}$

1,2,3... 1. When C₂ is entered as a word address:

C₂: Decrementing counter set value (4 digits BCD): 0000 to 9999 C₂ + 1: Decrementing time interval (4 digits BCD; unit: 0.1 ms): 0005 to 0320 (0.5 ms to 32 ms)

The meanings of the settings are the same as for the one-shot mode, but in the scheduled interrupt mode the timer PV will be reset to the set value and decrementing will begin again after the subroutine has been called. In the scheduled interrupt mode, interrupts will continue to be repeated at fixed intervals until the operation is stopped.

2. When C₂ is entered as a constant:

The settings are the same as for the one-shot mode, but interrupts will continue to be repeated at fixed intervals until the operation is stopped.

Reading the Timer's Elapsed Time

Use the STIM(69) instruction to read the timer's elapsed time.

 (@)STIM(69)	
	C1
	C2
	C ₃

C₁: Read elapsed time (006) C₂: Leading word of parameter 1 C₃: Parameter 2

 C_2 : Number of times the decrementing counter has been decremented (4 digits BCD)

 C_2 + 1: Decrementing counter time interval (4 digits BCD; unit: 0.1 ms)

C₃: Elapsed time from previous decrement (4 digits BCD; unit: 0.1 ms)

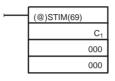

The time from when the interval timer is started until the execution of this instruction is calculated as follows:

{(Content of C2) \times (Content of C2+1) + (Content of C3)} \times 0.1 ms

If the specified interval timer is stopped, then "0000" will be stored.

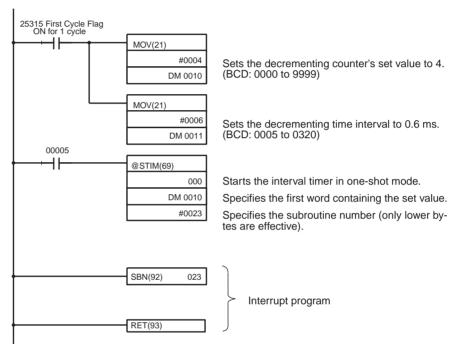

Stopping the Timer

Use the STIM(69) instruction to stop the interval timer. The interval timer will be stopped.

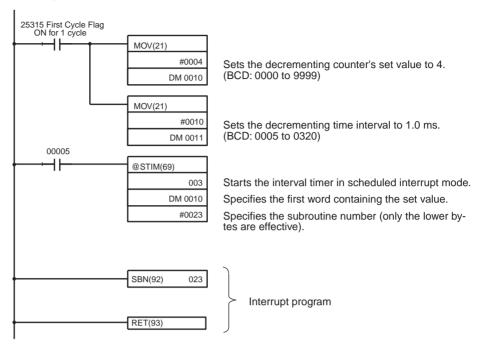

C₁: Stop interval timer (010)

Application Example (One-shot Mode) In this example, an interrupt is generated 2.4 ms (0.6 ms \times 4) after input 00005 goes ON; the interrupt executes interrupt subroutine number 23.

Application Example (Scheduled Interrupt Mode) In this example, an interrupt is generated every 4.0 ms (1.0 ms \times 4) after input 00005 goes ON; the interrupts execute interrupt subroutine number 23.

Section 1-8

1-8 CompoBus/S Distributed I/O Functions (SRM1 Only)

No. of Connected Nodes

A maximum of either 16 or 32 CompoBus/S nodes may be connected.

No. of nodes set	Communications response time
32	0.8 ms
16	0.5 ms

The maximum no. of nodes can be set from a Programming Device by making the following settings in DM 6603.

Word	Bit(s)	Function	Setting
DM 6603	00 to 03	Sets the maximum no. of CompoBus/S nodes to either 16 or 32.	00 or 01
		00: 32 nodes 01: 16 nodes	
	04 to 15	Not used.	00

Note When changes are made to these settings, always turn the power off and on again to make the new setting effective.

Slave Interrupts Input bits in IR 000 to IR 007 and output bits in IR 010 to IR 017 are used as interrupts for CompoBus/S I/O Terminals. The CompoBus/S I/O Terminal interrupts (IN 0 to 15 and OUT 0 to 15) are allocated as indicated in the following table.

IN0 to IN15 are the node addresses for the Input Terminals and OUT0 to OUT15 are the node addresses for the Output Terminals.

Wo	Word								E	Bit							
		15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Input	IR 000				IN	1							١١	10			
	IR 001				IN	3							11	12			
	IR 002				IN	5							11	14			
	IR 003				IN	7							11	16			
	IR 004				IN	9							11	18			
	IR 005		IN11 IN13			IN10											
	IR 006				IN12												
	IR 007				IN	15					IN14						
Output	IR 010		OUT1			OUT0											
	IR 011		OUT3 OUT2														
	IR 012				OU	T5				OUT4							
	IR 013 OUT7					OUT6											
	IR 014				OU	T9				OUT8							
	IR 015	OUT11					OUT10										
IR 016					OU	Г13				OUT12							
	IR 017				OU	Г15							OU	T14			

Note 1. When the maximum number of CompoBus/S nodes is set to 16, IN8 to IN15 can be used as work bits.

- 2. CompoBus/S Terminals with less than 8 points are allocated bit addresses from either 0 or 8.
- 3. CompoBus/S Terminals with 16 points can be set for only even number addresses.

Status Flags

The communications status between CompoBus/S terminals is output through AR04 to AR07 Slave Add Flags and Slave Communications Error Flags.

Word	Up	Uppermost bits: Slave Communications Error Flags						Lower Bits: Slave Add Flags								
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
AR04	OUT 7	OUT 6	OUT 5	OUT 4	OUT 3	OUT 2	OUT 1	OUT 0	OUT 7	OUT 6	OUT 5	OUT 4	OUT 3	OUT 2	OUT 1	OUT 0
AR05	IN7	IN6	IN5	IN4	IN3	IN2	IN1	IN0	IN7	IN6	IN5	IN4	IN3	IN2	IN1	IN0
AR06	OUT 15	OUT 14	OUT 13	OUT 12	OUT 11	OUT 10	OUT 9	OUT 8	OUT 15	OUT 14	OUT 13	OUT 12	OUT 11	OUT 10	OUT 9	OUT 8
AR07	IN15	IN14	IN13	IN12	IN11	IN10	IN9	IN8	IN15	IN14	IN13	IN12	IN11	IN10	IN9	IN8

Note

- 1. IN0 to IN15 are the input terminals and OUT0 to OUT15 are the output terminals.
 - 2. When the maximum number of CompoBus/S units is set to 16, IN8 to IN15 and OUT8 to OUT15 cannot be used.
 - 3. The Slave Add Flag turns ON when a slave joins the communications. When the power to the CPU Unit is turned OFF and ON again all bits will turn OFF.
 - 4. The Slave Communications Error Flag turns ON when a slave participating in the network is separated from the network. The bit will turn OFF when the slave re-enters the network.

Communications Functions 1-9

CQM1 Communications

The following types of communications can be executed through the ports of the CQM1.

- · Host link communications with a host computer
- RS-232C communications with a computer or other device
- One-to-one link communications with another CQM1

Note	• These types of communications cannot be carried out with the CQM1-CPU11-E, which is equipped with only a peripheral port.
	This section explains the required PC Setup and methods for using these types of communications.
CPM1/CPM1A Communications	The CPM1/CPM1A can execute a variety of communications through its peripheral port via an RS-232C Adapter or an RS-422 Adapter.
	Host Link Communications
	The CPM1/CPM1A PCs are compatible with the Host Link System, which allows up to 32 PCs to be controlled from a host computer. An RS-232C Adapter is used for 1-to-1 communications and an RS-422 Adapter and B500-AL004 Link Adapter are used for 1-to-n communications.
	A CPM1/CPM1A equipped with an RS-232C Adapter can also communicate with a Programmable Terminal using host link commands.
	Refer to 1-9-4 CPM1/CPM1A Host Link Communications in this manual and 1-2-2 Host Link Communications in the CPM1 Operation Manual or 1-2-2 Host Link Communications in the CPM1A Operation Manual for more details.
	1-to-1 Link
	A data link can be created with a data area in another CPM1, CPM1A, CQM1, or C200HS PC. An RS-232C Adapter is used to make the 1-to-1 connection.
	Refer to 1-9-8 CPM1/CPM1A One-to-one Link Communications in this man- ual and 1-2-3 1-to-1 Communications Links in the CPM1 Operation Manual or 1-2-3 1-to-1 Communications Links in the CPM1A Operation Manual for more details.
	NT Link
	Using the NT link, the CPM1/CPM1A PC can connected to the Programmable Terminal (NT Link Interface) through an RS-232C Adapter.
	Refer to 1-9-9 CPM1/CPM1A NT Link Communications in this manual and 1- 2-4 NT Link Communications in the CPM1 Operation Manual or NT Link Com- munications in the CPM1A Operation Manual for more details.
SRM1 Communications	The following types of communications can be executed through the ports of the SRM1.
	 Host link communications with a host computer
	 RS-232C communications with a computer or other device
	 One-to-one link communications with another SRM1
	 NT Link communications with Programmable Terminals
Note	• NT Link communications are not possible with the SRM1-C01, which is equipped with only a peripheral port. The SRM1-C01 may be connected to a PT through an RS-232C Adapter in Host Link mode.
1-9-1 CQM1 PC Se	tup
	The PC Setup parameters in DM 6645 through DM 6654 are used to set

The PC Setup parameters in DM 6645 through DM 6654 are used to set parameters for the communications ports. The parameters for the RS-232C port in DM 6645 through DM 6649 can be set from menu operations using the SSS.

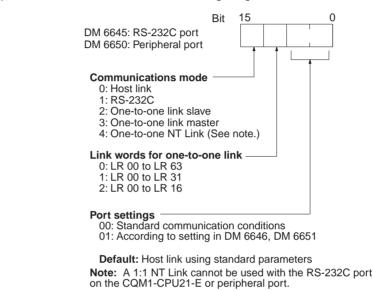

If pin 5 on the CQM1's DIP switch is turned ON, the PC Setup communications parameters will be ignored and the following parameters will be used.

Mode:	Host link
Node number:	00
Start bits:	1 bit

Data length:	7 bits
Stop bits:	2 bit
Parity:	Even
Baud rate:	9,600 bps
Transmission delay:	None

Note The above setting apply to CPU Units manufactured from July 1995 (lot number **75 for July 1995). For CPU Units manufactured before July 1995 (lot number **65 for June 1995), only 1 stop bit will be set and the baud rate will be 2,400 bps.

The settings in DM 6645 and DM 6650 determine the main communications parameters, as shown in the following diagram.

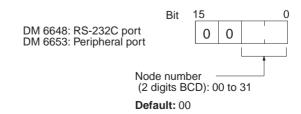

<u>One-to-one Links</u> To use a 1:1 link, the only settings necessary are the communications mode and the link words. Set the communications mode for one of the PCs to the 1:1 master and the other to the 1:1 slave, and then set the link words in the PC designated as the master. Bits 08 to 11 are valid only for the master for link one-to-one.

Note One-to-one link communications are possible for the RS-232C port only. This setting is not possible for the peripheral port. A 1:1 NT Link cannot be used with the CQM1-CPU21-E.

Host Link Node Number

A node number must be set for host link communications to differentiate between nodes when multiple nodes are participating in communications. This setting is required only for host link communications. To use host link communications, the host link must be specified as the communications mode and the communications parameters must be set (see following section).

Set the node number to 00 unless multiple nodes are connected in a network.

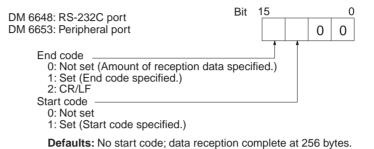

Standard

Communications

RS-232C Start and End Codes and Data Received

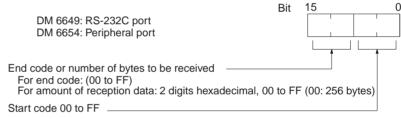

Start and end codes or the amount of data to be received can be set as shown in the following diagrams if required for RS-232C communications. This setting is required only for RS-232C communications. To use RS-232C communications, the RS-232C must be specified as the communications mode and the communications parameters must be set (see next section).

Enabling Start and End Codes

Specify whether or not a start code is to be set at the beginning of the data, and whether or not an end code is to be set at the end. Instead of setting the end code, it is possible to specify the number of bytes to be received before the reception operation is completed. Both the codes and the number of bytes of data to be received are set in DM 6649 or DM 6654.

Setting the Start Code, End Code, and Amount of Reception Data

Defaults: No start code; data reception complete at 256 bytes.

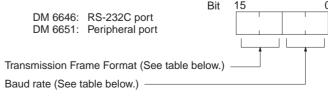

Host Link and RS-232C Communications Parameters

Select either host link or RS-232C communications and then set the communications parameters as described next. Match the communications conditions to the settings at the device with which communications are being carried out.

If the following settings are satisfactory for these communications conditions, then set the two rightmost digits to 00. The settings in DM 6646 and DM 6651 will be ignored for this setting.

Start bits: 1 bit Data length:7 bits Stop bits: 2 bits Parity: Even Baud rate: 9,600 bps

Setting Communications Conditions

Default: Standard communication conditions.

Transmission Frame Format

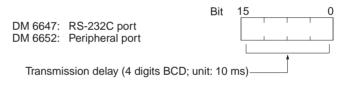

Setting	Stop bits	Data length	Stop bits	Parity
00	1	7	1	Even
01	1	7	1	Odd
02	1	7	1	None
03	1	7	2	Even
04	1	7	2	Odd
05	1	7	2	None
06	1	8	1	Even
07	1	8	1	Odd
08	1	8	1	None
09	1	8	2	Even
10	1	8	2	Odd
11	1	8	2	None

Baud Rate

Setting	Baud rate
00	1,200 bps
01	2,400 bps
02	4,800 bps
03	9,600 bps
04	19,200 bps

Transmission Delay Time

Depending on the devices connected to the RS-232 port, it may be necessary to allow time for transmission. When that is the case, set the transmission delay to regulate the amount of time allowed.

Default: No delay

1-9-2 Wiring Ports

Refer to the CQM1 Operation Manual, CPM1 Operation Manual, CPM1A Operation Manual or SRM1 Master Control Units Operation Manual for information on wiring the communications ports.

1-9-3 CQM1 Host Link Communications

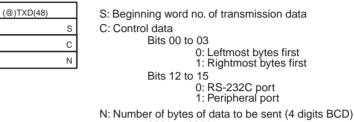

Host link communications were developed by OMRON for the purpose of connecting PCs and one or more host computers by RS-232C cable, and controlling PC communications from the host computer. Normally the host computer issues a command to a PC, and the PC automatically sends back a response. Thus the communications are carried out without the PCs being actively involved. The PCs also have the ability to initiate data transmissions when direct involvement is necessary.

In general, there are two means for implementing host link communications. One is based on C-mode commands, and the other on FINS (CV-mode) commands. The CQM1 supports C-mode commands only. For details on host link communications, refer to *SECTION 6 Host Link Commands*.

Section 1-9

Communications Procedure This section explains how to use the host link to execute data transmissions from the CQM1. Using this method enables automatic data transmission from the CQM1 when data is changed, and thus simplifies the communications process by eliminating the need for constant monitoring by the computer.

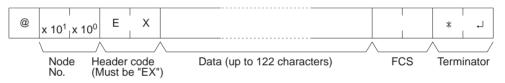

- 1,2,3... 1. Check to see that AR 0805 (RS-232C Port Transmit Ready Flag) is ON.
 - 2. Use the TXD(48) instruction to transmit the data.

0000 to 0256

From the time this instruction is executed until the data transmission is complete, AR 0805 (or AR 0813 for the peripheral port) will remain OFF. It will turn ON again upon completion of the data transmission. The TXD(48) instruction does not provide for a response, so in order to receive confirmation that the computer has received the data, the computer's program must be written so that it gives notification when data is written from the CQM1.

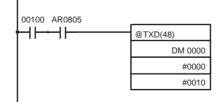

The transmission data frame is as shown below for data transmitted in the Host Link Mode by means of the TXD(48) instruction.

To reset the RS-232C port (i.e., to restore the initial status), turn ON SR 25209. To reset the peripheral port, turn ON SR 25208. These bits will turn OFF automatically after the reset.

If the TXD(48) instruction is executed while the CQM1 is in the middle of responding to a command from the computer, the response transmission will first be completed before the transmission is executed according to the TXD(48) instruction. In all other cases, data transmission based on a TXD(48) instruction will be given first priority.

Application Example This example shows a program for using the RS-232C port in the Host Link Mode to transmit 10 bytes of data (DM 0000 to DM 0004) to the computer. The default values are assumed for all the PC Setup (i.e., the RS-232C port is used in Host Link Mode, the node number is 00, and the standard communications conditions are used.) From DM 0000 to DM 0004, "1234" is stored in every word. From the computer, execute a program to receive CQM1 data with the standard communications conditions.

If AR 0805 (the Transmit Ready Flag) is ON when IR 00100 turns ON, the ten bytes of data (DM 0000 to DM 0004) will be transmitted.

The following type of program must be prepared in the host computer to receive the data. This program allows the computer to read and display the

data received from the PC while a host link read command is being executed to read data from the PC.

```
10 'COM1 SAMPLE PROGRAM FOR EXCEPTION
20 CLOSE 1
30 CLS
40 OPEN "COM:E73" AS #1
50 *KEYIN
60 INPUT "DATA
                ____″,S$
70 IF S$=" " THEN GOTO 190
80 PRINT "SEND DATA = ";S$
90 ST$=S$
100 INPUT "SEND OK? Y or N?=",B$
110 IF BS="Y" THEN GOTO 130 ELSE GOTO *KEYIN
120 S$=ST$
130 PRINT #1,S$
                                            'Sends command to PC
                                           'Receives response from PC
140 INPUT #1,R$
150 PRINT "RECV DATA = ";R$
                                           'Identifies command from PC
160 IF MID$(R$,4,2)="EX" THEN GOTO 210
170 IF RIGHT$(R$,1)<>"*" THEN S$=" ":GOTO 130
180 GOTO *KEYIN
190 CLOSE 1
200 END
210 PRINT "EXCEPTION!! DATA"
220 GOTO 140
         The data received by the computer will be as shown below. (FCS is "59.")
```

"@00EX123412341234123459*<u>CR</u>"

1-9-4 CPM1/CPM1A Host Link Communications

Host link communications were developed by OMRON for the purpose of connecting PCs and one or more host computers by RS-232C cable, and controlling PC communications from the host computer. Normally the host computer issues a command to a PC, and the PC automatically sends back a response. Thus the communications are carried out without the PCs being actively involved. The PCs also have the ability to initiate data transmissions when direct involvement is necessary.

In general, there are two means for implementing host link communications. One is based on C-mode commands, and the other on FINS (CV-mode) commands. The CPM1/CPM1A supports C-mode commands only. For details on host link communications, refer to SECTION 6 Host Link Commands.

PC Setup Settings The CPM1/CPM1A's peripheral port settings must be set properly in order to use the host link communications, as shown in the following table.

Word	Bit	Function	Setting
DM 6650	00 to 07	Port settings ¹ 00: Standard (1 start bit, 7-bit data, even parity, 2 stop bits, 9,600 bps) 01: Settings in DM 6651	00
		Link area for one-to-one PC link via peripheral port 0: LR 00 to LR 15	0 (Any value is OK)
	12 to 15	Communications mode ¹ 0: Host link; 2: One-to-one PC link (slave); 3: One-to-one PC link (master); 4: NT link	0

Communications Functions

Section 1-9

Word	Bit		F	unction		Setting
DM 6651	00 to 07	Baud rate ¹ 00: 1.2K, 01: 2.4K, 0	2: 4.8K, 03: 9.6K, 0)4: 19.2K		00 (Any value is OK)

	08 to 15	Not used.				00 (Any value is OK)

Note

1. If an improper setting is used, a non-fatal error will occur, AR 1302 will be turned ON, and the default setting (0, 00, or 0000) will be used.

- 2. For information on the host link settings for another OMRON PC, refer to that PC's Operation Manual.
- 3. If an out-of-range value is set, the following communications conditions will result. In that case, reset the value so that it is within the permissible range.

Communications mode:	Host Link
Communications format:	Standard settings (1 start bit, 7-bit data; even parity, 2 stop bits, 9,600 bps)
Transmission delay:	No
Node number:	00

Example ProgramThis example shows a BASIC program that reads the status of the CPM1's
inputs in IR 000. For more details, refer to SECTION 6 Host Link Commands.

An FCS (frame check sequence) check isn't performed on the received response data in this program. Be sure that the host computer's RS-232C port is configured correctly before executing the program.

```
1010 'CPM1 SAMPLE PROGRAM

```

1-9-5 SRM1 Host Link Communications

Host link communications were developed by OMRON for the purpose of connecting PCs and one or more host computers by RS-232C cable, and controlling PC communications from a host computer. Normally the host computer issues a command to a PC, and the PC automatically sends back a response. Thus the communications are carried out without the PCs being actively involved. The PCs also have the ability to initiate data transmissions when direct involvement is necessary.

In general, there are two means for implementing host link communications. One is based on C-mode commands, and the other on FINS (CV-mode) commands. The SRM1 supports C-mode commands only. For details on host link communications, refer to *SECTION 6 Host Link Commands*.

PC Setup Settings The SRM1's peripheral port and RS-232C port settings must be set properly in order to use the host link communications, as shown in the following table.

Word	Bit	Function	Setting
Peripheral F	ort Setting	js

Example Program This example shows a BASIC program that reads the status of the SRM1's inputs in IR 000. For more details, refer to SECTION 6 Host Link Commands. An FCS (frame check sequence) check isn't performed on the received response data in this program. Be sure that the host computer's RS-232C port is configured correctly before executing the program. 1000 / _____ 1010 'SRM1 Sample Program for PC-9801 N88-BASIC 1020 ' 1050 ′ -----1060 'Set value RS-232C SPEED:9600BPS, PARITY: EVEN, DA-TA:7,STOP:2--1070 OPEN "COM:E73" AS #1 1080 *REPEAT 1090 '---Transmission data input -----1100 INPUT "send data:",SEND\$ 1110 '---FCS Calculation -----1120 FCS=0 1130 FOR IFCS=1 TO LEN(SENDS) 1140 FCS=FCS XOR ASC(MID\$(SEND\$; IFCS, 1) 1150 NEXT 1160 FCS\$=RIGHT\$("0"+HEX\$(FCS),2) 1170 '---Communications execute ------1180 ZZZ\$=SEND\$+FCS\$+"*"+CHR\$(13) 1190 PRINT #1,ZZZ\$; 1200 '---Response check -----1210 RECCNT=0:TMP\$="" 1220 *DRECLOOP 1230 IF LOC(1) <>0 THEN *DREC1 1240 RECCNT=RECCNT+1 1250 IF RECCNT=5000 THEN *DRECERR ELSE *DRECLOOP 1260 *DREC1 1270 TMP\$=TMP\$+INPUT\$(LOC(1),#1) 1280 IF RIGHT\$(TMP\$,1)=CHR\$(13) THEN *DRECEND ELSE RECCNT=0:GOTO *DRECLOOP 1290 *DRECERR 1300 TMP\$="No response!!"+CHR\$(13) 1310 *DRECEND 1320 RECV\$=TMP\$ 1330 PRINT "receive data:";RECV\$ 1340 '---Go to transmission data input ------1350 GOTO *REPEAT 1360 '---Processing complete -----1370 CLOSE #1 1380 END

1-9-6 RS-232C Communications (CQM1/SRM1 Only)

This section explains RS-232C communications. By using RS-232C communications, the data can be printed out by a printer or read by a bar code reader. Handshaking is not supported for RS-232C communications.

Communications Procedure

Transmissions

1,2,3... 1. Check to see that AR 0805 (the RS-232C Port Transmit Ready Flag) has turned ON.

2. Use the TXD(48) instruction to transmit the data.

 (@)TXD(48)		
	S	
	С	
	Ν	

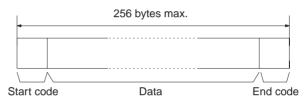

S: Leading word no. of data to be transmitted

C: Control data

N: Number of bytes to be transmitted (4 digits BCD), 0000 to 0256

From the time this instruction is executed until the data transmission is complete, AR 0805 (or AR0813 for the peripheral port) will remain OFF. (It will turn ON again upon completion of the data transmission.)

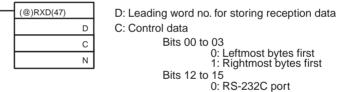

Start and end codes are not included when the number of bytes to be transmitted is specified. The largest transmission that can be sent with or without start and end codes in 256 bytes, N will be between 254 and 256 depending on the designations for start and end codes. If the number of bytes to be sent is set to 0000, only the start and end codes will be sent.

To reset the RS-232C port (i.e., to restore the initial status), turn on SR 25209. To reset the peripheral port, turn on SR 25208. These bites will turn OFF automatically after the reset.

Receptions

- **1,2,3...** 1. Confirm that AR 0806 (RS-232C Reception Complete Flag) or AR 0814 (Peripheral Reception Complete Flag) is ON.
 - 2. Use the RXD(47) instruction to receive the data.

1: Peripheral port

N: Number of bytes stored (4 digits BCD), 0000 to 0256

 The results of reading the data received will be stored in the AR area. Check to see that the operation was successfully completed. The contents of these bits will be reset each time RXD(47) is executed.

RS-232C port	Peripheral port	Error
AR 0800 to AR 0803	AR 0808 to AR 0811	RS-232C port error code (1 digit BCD) 0: Normal completion 1: Parity error 2: Framing error 3: Overrun error
AR 0804	AR0812	Communications error
AR 0807	AR0815	Reception Overrun Flag (After reception was com- pleted, the subsequent data was received before the data was read by means of the RXD(47) instruction.)
AR 09	AR10	Number of bytes received

To reset the RS-232C port (i.e., to restore the initial status), turn ON SR 25209. To reset the peripheral port, turn ON SR 25208. These bits will turn OFF automatically after the reset.

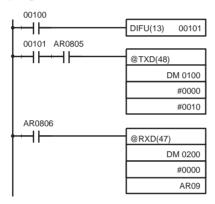

The start code and end code are not included in AR 09 or AR 10 (number of bytes received).

Application Example This example shows a program for using the RS-232C port in the RS-232C Mode to transmit 10 bytes of data (DM 0100 to DM 0104) to the computer, and to store the data received from the computer in the DM area beginning with DM 0200. Before executing the program, the following PC Setup setting must be made.

DM 6645: 1000 (RS-232C port in RS-232C Mode; standard communications conditions)

DM 6648: 2000 (No start code; end code CR/LF)

The default values are assumed for all other PC Setup settings. From DM 0100 to DM 0104, 3132 is stored in every word. From the computer, execute a program to receive CQM1 data with the standard communications conditions.

If AR 0805 (the Transmit Ready Flag) is ON when IR 00100 turns ON, the ten bytes of data (DM 0100 to DM 0104) will be transmitted, left-most bytes first.

When AR 0806 (Reception Completed Flag) goes ON, the number of bytes of data specified in AR 09 will be read from the CQM1's reception buffer and stored in memory starting at DM 0200, leftmost bytes first.

The data will be as follows: "31323132313231323132CR LF"

1-9-7 CQM1 One-to-one Link Communications

If two CQM1s are linked one-to-one by connecting them together through their RS-232C ports, they can share common LR areas. When two CQM1s are linked one-to-one, one of them will serve as the master and the other as the slave.

Note The peripheral port cannot be used for 1:1 links.

One-to-one Links A one-to-one link allows two CQM1s to share common data in their LR areas. As shown in the diagram below, when data is written into a word the LR area of one of the linked Units, it will automatically be written identically into the same word of the other Unit. Each PC has specified words to which it can write and specified words that are written to by the other PC. Each can read, but cannot write, the words written by the other PC.

Master			Slave	
Master area	Write "1"		1	Master area
		Written automatically.		
Slave area	1	+	1 - Write	Slave area

The word used by each PC will be as shown in the following table, according to the settings for the master, slave, and link words.

DM 6645 setting	LR 00 to LR 63	LR 00 to LR 31	LR 00 to LR 15
Master words	LR00 to LR31	LR00 to LR15	LR00 to LR07
Slave words	LR32 to LR63	LR16 to LR31	LR08 to LR15

Communications Procedure

Link Errors

Application Example

If the settings for the master and the slave are made correctly, then the oneto-one link will be automatically started up simply by turning on the power supply to both the CQM1s and operation will be independent of the CQM1 operating modes.

If a slave does not received a response from the master within one second, the 1:1 Link Error Flag (AR 0802) and the Communications Error Flag (AR 0804) will be turned ON.

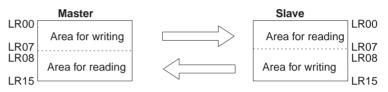

This example shows a program for verifying the conditions for executing a one-to-one link using the RS-232C ports. Before executing the program, set the following PC Setup parameters.

Master: DM 6645: 3200 (one-to-one link master; Area used: LR 00 to LR 15)

Slave: DM 6645: 2000 (one-to-one link slave)

ı

The defaults are assumed for all other PC Setup parameters. The words used for the one-to-one link are as shown below.

When the program is executed at both the master and the slave, the status of IR 001 of each Unit will be reflected in IR 100 of the other Unit. Likewise, the status of the other Unit's IR 001 will be reflected in IR 100 of each Unit. IR 001 is an input word and IR 100 is an output word

In the Master

Section 1-9

1-9-8 CPM1/CPM1A One-to-one Link Communications

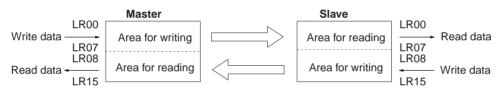

In a one-to-one link, a CPM1/CPM1A is linked to another CPM1/CPM1A, a CQM1, or a C200HS through an RS-232C Adapter and standard RS-232C cable. One of the PCs will serve as the master and the other as the slave. The one-to-one link can connect up to 256 bits (LR 0000 to LR 1515) in the two PCs.

One-to-one CPM1/CPM1A Links The following diagram shows a one-to-one link between two CPM1s PCs. Refer to the *CPM1A Operation Manual* for the corresponding information on the CPM1A.

RS-232C Cable

The words used for the one-to-one link are as shown below.

Limitations of One-to-one Links with a CPM1/CPM1A

Only the 16 LR words from LR 00 to LR 15 can be linked in the CPM1/ CPM1A, so use only those 16 words in the CQM1 or C200HS when making a one-to-one link with one of those PCs. A one-to-one link cannot be made to a CPM1/CPM1A PC using LR 16 through LR 63 in the CQM1 or C200HS.

PC Setup Settings

The settings relating to 1-to-1 PC communications must be set as shown in the following table.

Word	Bit	Function	Setting (Master)	Setting (Slave)
DM 6650	00 to 07	Port settings ¹ 00: Standard (1 start bit, 7-bit data, even parity, 2 stop bits, 9,600 bps) 01: Settings in DM 6651	00 (Any value is OK)	00 (Any value is OK)
	08 to 11	Link area for one-to-one PC link via peripheral port 0: LR 00 to LR 15	0	0 (Any value is OK)
	12 to 15	Communications mode ¹ 0: Host link; 2: 1-to-1 PC link (slave); 3: 1-to-1 PC link (master); 4: NT link	3	2

Note 1. If an improper setting is used, a non-fatal error will occur, AR 1302 will be turned ON, and the default setting (0 or 00) will be used.

- 2. For information on the 1-to-1 link settings for another OMRON PC, refer to that PC's Operation Manual.
- 3. For information on CPM1/CPM1A one-to-one link connections and wiring diagrams refer to 3-4-7 Host Link Connections in the CPM1 Operation Manual or CPM1A Operation Manual. For the SRM1 refer to 3-4-4 RS-232C Port Wiring in the SRM1 Master Control Unit Operation Manual.

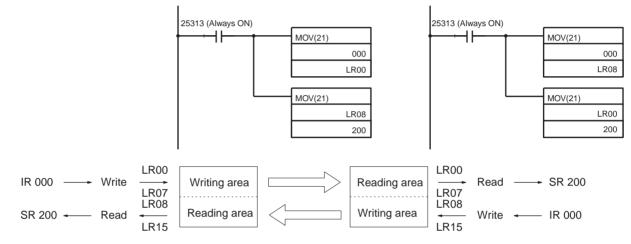

4. If an out-of-range value is set, the following communications conditions will result. In that case, reset the value so that it is within the permissible range.

Communications mode:	Host Link
Communications format:	Standard settings (1 start bit, 7-bit data; even parity, 2 stop bits, 9,600 bps)
Transmission delay:	No
Node number:	00

Example Program This example shows ladder programs that copy the status of IR 000 in each CPM1/CPM1A to SR 200 in the other CPM1/CPM1A.

Program in the Master

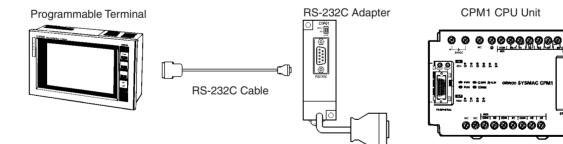

Program in the Slave

1-9-9 CPM1/CPM1A NT Link Communications

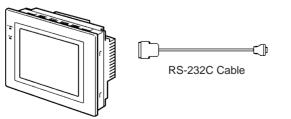

Using the NT link, the CPM1/CPM1A PC can connected to the Programmable Terminal (NT Link Interface) through an RS-232C Adapter.

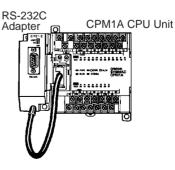

CPM1 PCs

CPM1A PCs

OMRON Programmable Terminal

Communications Functions

PC Setup Settings

The settings relating to NT link PC communications must be set as shown in the following table.

Word	Bit	Function	Setting
DM 6650	00 to 07	Port settings ¹ 00: Standard (1 start bit, 7-bit data, even parity, 2 stop bits, 9,600 bps) 01: Settings in DM 6651	00 (Any value is OK)
	08 to 11	Link area for one-to-one PC link via peripheral port 0: LR 00 to LR 15	0 (Any value is OK)
	12 to 15	Communications mode ¹ 0: Host link; 2: 1-to-1 PC link (slave); 3: 1-to-1 PC link (master); 4: NT link	4

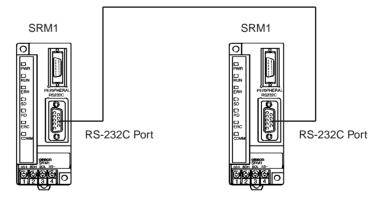

- **Note** 1. If an improper setting is used, a non-fatal error will occur, AR 1302 will be turned ON, and the default setting (0 or 00) will be used.
 - 2. For information on the NT link settings for another OMRON PC, refer to that PC's Operation Manual.
 - 3. If an out-of-range value is set, the following communications conditions will result. In that case, reset the value so that it is within the permissible range.

Communications mode:	Host Link
Communications format:	Standard settings (1 start bit, 7-bit data; even parity, 2 stop bits, 9,600 bps)
Transmission delay:	No
Node number:	00

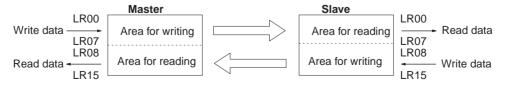

1-9-10 SRM1 One-to-one Link Communications

In a one-to-one link, a SRM1 is linked to another SRM1, CPM1/CPM1A, a CQM1, or a C200HS through an RS-232C Adapter and standard RS-232C cable. One of the PCs will serve as the master and the other as the slave. The one-to-one link can connect up to 256 bits (LR 0000 to LR 1515) in the two PCs.

One-to-one SRM1 Links The following diagram shows a one-to-one link between two SRM1s.

The words used for the one-to-one link are as shown below.

Limitations of One-to-one Links with a SRM1

Only the 16 LR words from LR 00 to LR 15 can be linked in the SRM1, so use only those 16 words in the CQM1 or C200HS when making a one-to-one link with one of those PCs. A one-to-one link cannot be made to a SRM1 PC using LR 16 through LR 63 in the CQM1 or C200HS.

PC Setup Settings

The settings relating to 1-to-1 PC communications must be set as shown in the following table.

Word	Bit	Function	Setting (Master)	Setting (Slave)
DM 6645	00 to 03	Port settings ¹ 00: Standard (1 start bit, 7-bit data, even parity, 2 stop bits, 9,600 bps) 01: Settings in DM 6651	Any	Any
	04 to 07	CTS Control settings 0: Disable 1: Set	0	0
	08 to 11	Link area for one-to-one PC link via peripheral port 0: LR 00 to LR 15	0	0
	12 to 15	Communications mode ¹ 0: Host link; 1: No protocol; 2: 1-to-1 PC link (slave); 3: 1-to-1 PC link (mas- ter); 4: NT link	3	2

Note 1. If an improper setting is used, a non-fatal error will occur, AR 1302 will be turned ON, and the default setting (0 or 00) will be used.

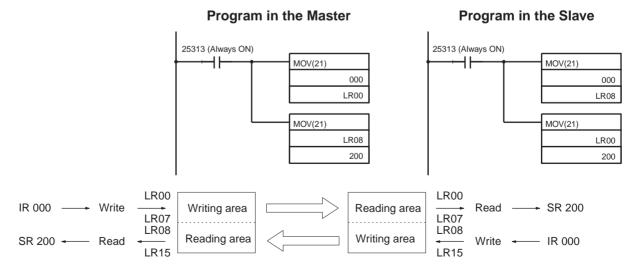

- 2. For information on the 1-to-1 link settings for another OMRON PC, refer to that PC's Operation Manual.
- 3. If an out-of-range value is set, the following communications conditions will result. In that case, reset the value so that it is within the permissible range. Communications mode: Host Link Communications format: Standard settings

(1 start bit, 7-bit data; even parity, 2 stop bits, 9,600 bps)

Example Program

This example shows ladder programs that copy the status of IR 000 in each SRM1 to SR 200 in the other SRM1.

1-9-11 SRM1 NT Link Communications

Using the NT link, the SRM1 PC can be connected to the Programmable Terminal (NT Link Interface.) The RS-232C port can be used to the NT Link.

NT Link is possible only with the SRM1-C02-V1, which has an RS-232C port.

		05:	1 bit	7 bits	2 bit	None			
		06:	1 bit	8 bits	1 bit	Even			
		07:	1 bit	8 bits	1 bit	Odd			
		08:	1 bit	8 bits	1 bit	None			
		09:	1 bit	8 bits	2 bit	Even			
		10:	1 bit	8 bits	2 bit	Odd			
		11:	1 bit	8 bits	2 bit	None			
DM 6647	00 to 15			y (Host Link)			As		
		0000 to	9999 (BC	D): Set in units of	[:] 10 ms, e.g., se	etting of 0001 equals 10 ms	required		

Word	Bit	Function	Setting
DM 6648	00 to 07	Node number (Host link, effective when bits 12 to 15 of DM 6645 are set to 0.) 00 to 31 (BCD)	As required
	08 to 11	Start code enable (RS-232C, effective when bits 12 to 15 of DM 6645 are set to 1.) 0: Disable; 1: Set	As required
	12 to 15	End code enable (RS-232C, effective when bits 12 to 15 of DM 6645 are set to 1.) 0: Disable (number of bytes received) 1: Set (specified end code) 2: CR, LF	
DM 6649	00 to 07	Start code (RS-232C) 00: 256 bytes 01 to FF: 1 to 255 bytes	
	08 to 15	End code enable (RS-232C)	
		00 to FF (BIN)	

Note If an out-of-range value is set, the following communications conditions will result. In that case, reset the value so that it is within the permissible range.

Communications mode:	Host Link
Communications format:	Standard settings
	(1 start bit, 7-bit data; even parity, 2 stop bits,
	9,600 bps)
Transmission delay:	No
Node number:	00

1-9-13 Transmission Data Configuration

When no-protocol communications are used, TXD(48) is used to send data and RXD(47) to receive data. The maximum amount of data that can be either sent or received is 259 bytes, including the start/end code.

• No Start or End Code:

	Data (256 bytes max.)			
Only a Start 0	Cod	e:		
	ST	Data (256 bytes max.)		
Only an End	Cod	le:		
		Data (256 bytes max.)		ED
Both an Start	t and	d End Code:		
	ST	Data (256 bytes max.)		ED
End Code of	CR,	LF:		
		Data (256 bytes max.)	CR	LF
Start Code 00	0-FF	/End Code CR,LF:		
	ST	Data (256 bytes max.)	CR	LF

Note 1. The start and end codes are set in DM 6648 to DM 6649 and DM 6653 to DM 6654 of the PC Setup.

- 2. When there are several start and end codes, the first part of each will be effective.
- 3. When the end code duplicates the transmission data and the transmission is stopped part way through, use CR or LF as the end code.
- 4. The start and end codes are not stored.

1-9-14 Transmission Flags

When sending data from the SRM1, check that the Transmission Enable Flag is ON for executing the TXD(48) instruction. The Transmission Enable Flag will turn OFF while the data is being transmitted and will turn ON again when transmission is complete.

After the SRM1 has received data, the Receive Enable Flag turns ON. When the RXD instruction is executed, the data received will be written to the specified words and the Reception Complete Flag will turn OFF.

Flag	Peripheral port	RS-232C port
Transmission Enable Flag	AR 0813	AR 0805
Reception Complete Flag	AR 0814	AR 0806

Note The timing from data reception starting to completion for the SRM1 is as indicated below.

Reception Start:

Without start code: With start code:

Normal reception status After start code is received.

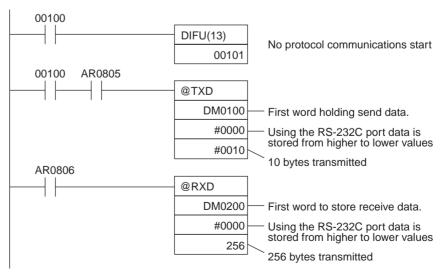

Reception Complete:

When either the end code, the specified no. of bytes, or 256 bytes are received.

1-9-15 No Protocol Communications Program Example

The following program example is for no protocol communication conducted through a RS-232C port using TXD(48) and RXD(47) instructions.

If AR 0805 (Transmission Enable Flag) is ON when 00100 is ON, then data from DM0100 to DM0104 is transmitted from higher to lower values. When AR 0806 (Reception Enable Flag) turns ON, 256 bytes of received data are read and written to DM 0200 from higher to lower values.

1-10 Calculating with Signed Binary Data

The CQM1/CPM1/CPM1A/SRM1 allow calculations on signed binary data. The following instructions manipulate signed binary data. Signed data is handled using 2's complements.

	•			
CQM1 Instructions	The following signed-binary instructions are available in CQM1 PCs:			
	Single-word Instructions			
	 2'S COMPLEMENT – N 	IEG(—)		
	• BINARY ADD – ADB(50)

Signed Data Calculations				
orginoa Data Carcalationo	Addition	Subtraction		
	7 + 3 = 10 (-7) + 3 = -4	7 - 3 = 4 (-7) - 3 = -10		
		(-7) - 3 = -10 7 - (-3) = 10		
	(-7) + (-3) = -10			
	Multiplication	Division		
	$7 \times 3 = 21$	$7 \div 3 = 2$ with a remainder of 1		
	$(-7) \times 3 = -21$	$(-7) \div 3 = -2$ with a remainder of -1		
	$7 \times (-3) = -21$	$7 \div (-3) = -2$ with a remainder of 1		

1-10-1 Definition of Signed Binary Data

The CQM1 provides instructions that operate on either one or two words of data; the CPM1/CPM1A/SRM1 provide just two instructions that operate on one word of data. Signed binary data is manipulated using 2's complements and the MSB of the one- or two-word data is used as the sign bit. The range of data that can be expressed using one or two words is thus as follows:

 $(-7) \div (-3) = 2$ with a remainder of -1

• One-word data:

 $(-7) \times (-3) = 21$

-32,768 to 32,767 (8000 to 7FFF hexadecimal)

• Two-word data:

-2,147,483,648 to 2,147,483,647 (8000 0000 to 7FFF FFFF hexadecimal)

Decimal	16-bit Hex	32-bit Hex
2147483647		7FFFFFFF
2147483646		7FFFFFE
	•	•
32768		0008000
32767	7FFF	00007FFF
32766	7FFE	00007FFE
2	0002	0000002
1 0	0001 0000	00000001 00000000
-1	FFFF	FFFFFFF
-2	FFFE	FFFFFFE
–32767	8001	FFFF8001
-32768	8000	FFFF8000
-32769		FFFF7FFF
· ·	•	
-2147483647		80000001
-2147483648		8000000

The following table shows equivalents between decimal and hexadecimal data.

1-10-2 Arithmetic Flags

The results of executing signed binary instructions is reflected in the arithmetic flags. The flags and the conditions under which it will turn ON are given in the following table. The flags will be OFF when these conditions are not met.

Flag	ON conditions
Carry Flag (SR 25504)	Carry in an addition.
	Negative results for subtraction.
Equals Flag (SR 25506)	The results of addition, subtraction, multiplica- tion, or division is 0.
	Results of converting 2's complement is 0.
Overflow Flag (SR 25404)	32,767 (7FFF) was exceeded in results of 16-bit addition or subtraction.
	2,147,483,647 (7FFF FFFF) was exceeded in results of 32-bit addition or subtraction.
Underflow Flag (SR 25405)	-32,768 (8000) was exceeded in results of 16-bit addition or subtraction, or conversion of 2's complement.
	-2,147,483,648 (8000 0000) was exceeded in results of 32-bit addition or subtraction, or conversion of 2's complement.

1-10-3 Inputting Signed Binary Data Using Decimal Values

Although calculations for signed binary data use hexadecimal expressions, inputs from the Programming Console or SSS can be done using decimal inputs and mnemonics for the instructions. The procedure to using the Programming Console to input using decimal values is shown in the *CQM1 Operation Manual*, *CPM1 Operation Manual*, *CPM1A Operation Manual and SRM1 Master Control Unit Operation Manual*. Refer to the *SSS Operation Manual*: *C-series PCs* for details on using the SSS.

Input Instructions Only 16-bit operands can be input for the following instructions: NEG(—), ADB(50), SBB(51), MBS(—), and DBS(—). Refer to the CQM1 Operation Manual, CPM1 Operation Manual, CPM1A Operation Manual or SRM1 Master Control Unit Operation Manual for details on inputting instructions from the Programming Console.

1-10-4 Using Signed-binary Expansion Instructions (CQM1 Only)

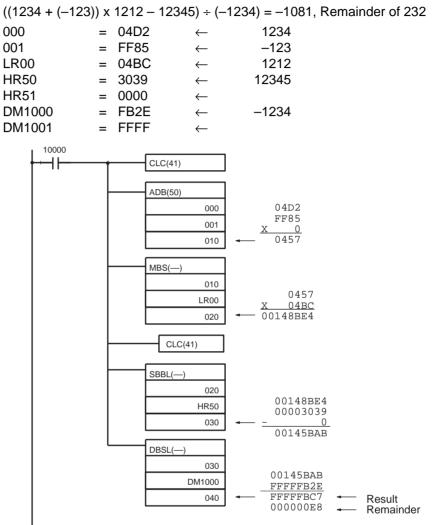

The following CQM1 instructions must be allocated function codes in the instructions table before they can be used.

- DOUBLE BINARY ADD ADBL(----)
- DOUBLE BINARY SUBTRACT SBBL(---)
- SIGNED BINARY MULTIPLY MBS(-----)
- DOUBLE SIGNED BINARY MULTIPLY MBSL(-----)
- SIGNED BINARY DIVIDE DBS(---)
- DOUBLE SIGNED BINARY DIVIDE DBSL(----)

Allocating Function Codes The procedure to using the Programming Console to allocate function codes is shown in the *CQM1 Operation Manual*. Be sure that pin 4 on the CQM1's DIP switch is turned ON to enable use of a user-set instruction table before performing this operation.

1-10-5 Application Example Using Signed Binary Data

The following programming can be used to performed calculations such as the following in the CQM1:

SECTION 2 Special Features

This section provides an introduction to some of the main CQM1/CPM1/CPM1A/SRM1 features, including the instructions available through expansion instructions, a monitoring feature called differential monitoring, and the analog setting function available in the CQM1-CPU42-EV1 and CPM1/CPM1A PCs.

If you are not familiar with OMRON PCs or ladder diagram program, you can skim over this section as an overview of these features, but will want to read *SECTION 3 Memory Areas* and *SECTION 4 Ladder-diagram Programming* before reading this section in detail. Also, details on programming instructions can be found in *SECTION 5 Instruction Set*.

Section 2-1

2-1 Expansion Instructions (CQM1/SRM1 Only)

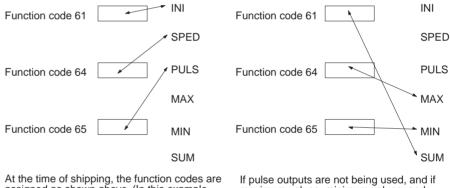

A set of expansion instructions is available for the CQM1/SRM1 to aid in special programming needs. Function codes can be assigned to up to 18 of the expansion instructions to enable using them in programs. This allows the user to pick the instructions needed by each CQM1 or SRM1 program to more effectively use the function codes required to input instructions.

The mnemonics of expansion instructions are followed by "(—)" as the function code to indicate that they must be assigned function codes by the user in the instructions table before they can be used in programming (unless they are used under their default settings).

Any of the instructions not assigned function codes will need to be assigned function codes in the instructions table used by the Programming Device and the CQM1 or SRM1 before they can be used in programming. The assignments of expansion instructions in the instructions table will change the meaning of instructions and operands, so be sure to set the instructions table before programming and transfer the proper instructions table to the CQM1 or SRM1 before program execution.

Example: CQM1 PCs

The specific instructions used in the following example are for the CQM1. The concepts are the same for the SRM1.

At the time of shipping, the function codes are assigned as shown above. (In this example, the instructions all relate to pulse outputs.) If pulse outputs are not being used, and if maximum values, minimum values, and sums are required, then the Set Instructions operation can be used as shown above to reassign instructions in the instruction table.

Note Set the PC model to "CQM1" when setting the expansion instructions for the SRM1 or CQM1 from the SSS.

2-1-1 **CQM1** Expansion Instructions

The following 18 function codes can be used for expansion instructions: 17, 18, 19, 47, 48, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 87, 88, and 89

The expansion instructions that can be used are listed below, along with the on codes that are assigned when the CQM1 is shipped. Instrucwith a "*" are available only in CQM1-CPU4 -EV1 CPU Units.

Mnemonic	Function code	Mnemonic	Function code	Mnemonic	Function code
ASFT	17	INT	89	ADBL*	
TKY	18	HKY		SBBL*	
MCMP	19	FPD		MBS*	
RXD	47	SRCH		DBS*	
TXD	48	MAX		MBSL*	
CMPL	60	MIN		DBSL*	
INI	61	APR		CPS*	
PRV	62	LINE		CPSL*	
CTBL	63	COLM		NEG*	
SPED	64	SEC		NEGL*	
PULS	65	HMS		ZCP*	
SCL	66	SUM		ZCPL*	
BCNT	67	FCS		XFRB*	
BCMP	68	HEX		PLS2*	
STIM	69	AVG		ACC*	
DSW	87	PWM*		SCL2*	
7SEG	88	PID*		SCL3*	

With the CQM1, an instructions table can also be stored on Memory Cassettes when they are used. Exercise care when using a Memory Cassette that has been used with another CQM1 or SRM1 and be sure the proper instructions table is present.

/ Caution If pin no. 4 of the CQM1's DIP switch is set to OFF, only expansion instructions on the default instructions table can be used and the user-set instructions table will be ignored. The default instructions table will also be set whenever power is turned on, deleting any previous settings.

> Make sure that pin 4 of the CPU Unit DIP switch is ON when reading a program from the Memory Cassette that has a user-set expansion instructions table. If pin 4 is OFF, the default instructions table will be used for expansion instructions in programs read from a Memory Cassette. (In this case, the program read from the Memory Cassette and the program on the Memory Cassette will not match when the two are compared.)

2-1-2 **SRM1** Expansion Instructions

The following 18 function codes can be used for expansion instructions: 17, 18, 19, 47, 48, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 87, 88, and 89

The expansion instructions that can be used are listed below, along with the default function codes that are assigned when the SRM1 is shipped.

Mnemonic	Function code
ASFT	17
RXD	47
TXD	48
CMPL	60

		 ult function marked v
;	Function code	Mnemo
	17	INT
	18	HKY

STUP	

2-2 Advanced I/O Instructions (CQM1 Only)

Advanced I/O instructions enable control, with a single instruction, of previously complex operations involving external I/O devices (digital switches, 7segment displays, etc.). This section introduces advanced I/O instructions, which are also covered at the end of *SECTION 5 Instruction Set*.

There are four advanced I/O instructions, as shown in the following table. All of these are expansion instructions and must be assigned to function codes before they can be used.

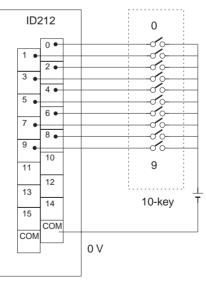

Name	Mnemonic	Function
TEN-KEY INPUT	TKY(18)	BCD input from 10-key keypad
HEXADECIMAL KEY INPUT	HKY(—)	Hexadecimal input from 16-key keypad
DIGITAL SWITCH INPUT	DSW(87)	SV input from digital switch
7-SEGMENT DISPLAY OUTPUT	7SEG(88)	BCD output to 7-segment dis- play

2-2-1 **TEN-KEY INPUT – TKY(18)**

This instruction inputs 8 digits in BCD from a 10-key keypad and uses 10 input points.

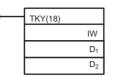

Hardware

Prepare a 10-key keypad, and connect it so that the switches for numeric keys 0 through 9 are input to points 0 through 9 as shown in the following diagram. Either the input terminals on the CPU Unit or the inputs on a DC Input Unit with 16 or more input points can be used.

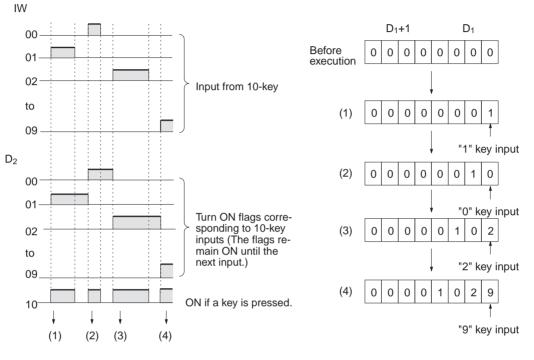

DC Input Unit

Using the Instruction

IW: Input word D₁: First register word D₂: Key input word

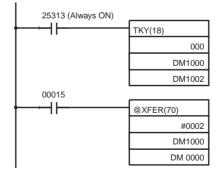

If the input word for connecting the 10-key keypad is specified for IW, then operation will proceed as shown below when the program is executed.

Note

- 1. While one key is being pressed, input from other keys will not be accepted.
 - If more than eight digits are input, digits will be deleted beginning with the leftmost digit.
 - 3. Input bits not used here can be used as ordinary input bits.
- **Application Example**

In this example, a program for inputting numbers from the 10-key is shown. Assume that the 10-key is connected to IR 000.

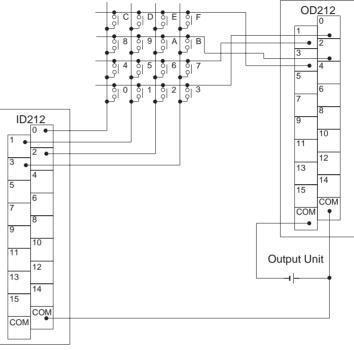

The 10-key information input to IR 000 using TKY(18) is converted to BCD and stored in DM 1000 and DM 1001. Key information is stored in DM 1002. IR 00015 is used as an "ENTER key," and when IR 00015 turns ON, the data stored in DM 1000 and DM 1001 will be transferred to DM 0000 and DM 0001.

This instruction inputs 8 digits in hexadecimal from a hexadecimal keyboard. It utilizes 5 output bits and 4 input bits.

Hardware

Prepare the hexadecimal keyboard, and connect the 0 to F numeric key switches, as shown below, to input points 0 through 3 and output points 0 through 3. Output point 4 will be turned ON while any key is being pressed, but there is no need to connect it.

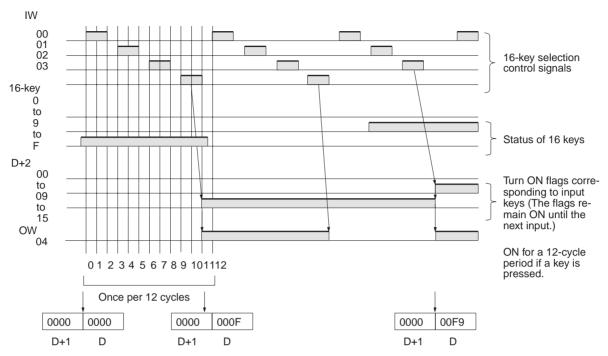

Input Unit

The inputs can be connected to the input terminals on the CPU Unit or a DC Input Unit with 8 or more input points and the outputs can be connected from a Transistor Output Unit with 8 points or more.

Using the Instruction

 НКҮ	
	IW
	0W
	D

IW: Input word OW: Control signal output word D: First register word

If the input word for connecting the hexadecimal keyboard is specified at IW, and the output word is specified at OW, then operation will proceed as shown below when the program is executed.

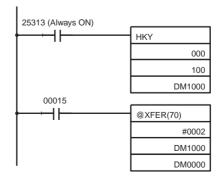

SR 25408 will turn ON while HKY(---) is being executed.

Note

- 1. Do not use HKY(—) more than once within the same program.
 - When using HKY(—), set the input constant for the relevant input word to less than the cycle time. (Input constants can be changed from DM 6620 onwards.)
 - 3. While one key is being pressed, input from other keys will not be accepted.
 - 4. If more than eight digits are input, digits will be deleted beginning with the leftmost digit.
 - Input and output bits not used here can be used as ordinary input and output bits.

With this instruction, one key input is read in 3 to 12 cycles. More than one cycle is required because the ON keys can only be determined as the outputs are turned ON to test them.

Application Example This example shows a program for inputting numbers from a hexadecimal keyboard. Assume that the hexadecimal keyboard is connected to IR 000 (input) and IR 100 (output).

The hexadecimal key information that is input to IR 000 by HKY(—) is converted to hexadecimal and stored in words DM1000 and DM1001.

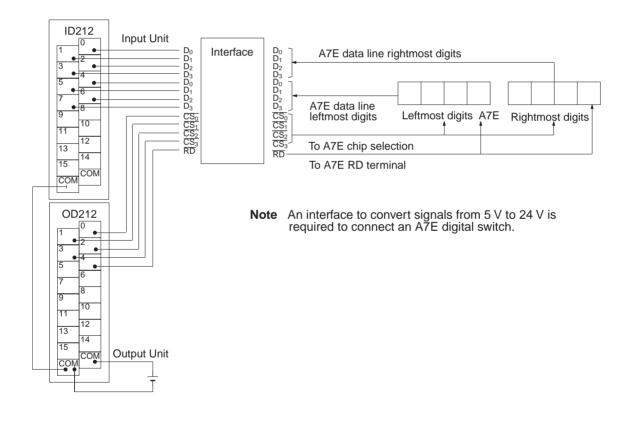

IR 00015 is used as an "ENTER key," and when IR 00015 turns ON, the numbers stored in DM 1000 and DM 1001 are transferred to DM 0000 and DM 0001.

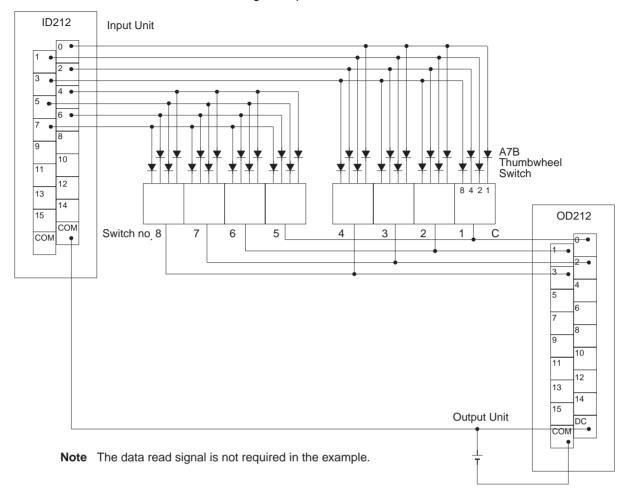

2-2-3 DIGITAL SWITCH INPUT – DSW(87)

With this instruction, 4-digit or 8-digit BCD set values are read from a digital switch. DSW(87) utilizes 5 output bits and either 4 input bits (for 4 digits) or 8 input bits (for 8 digits).

Hardware

Connect the digital switch and the Input and Output Units as shown in the diagram below. In the diagram, an 8-digit input is shown. When using a 4-digit input, connect D0 through D3 from the digital switch to input points 0 through 3. In either case, output point 5 will be turned ON when one round of data is read, but there is no need to connect output point 5 unless required for the application.

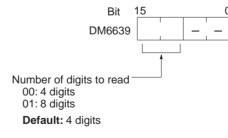

The following example illustrates connections for an A7B Thumbwheel Switch.

The inputs can be connected to the CPU Unit's input terminals or a DC Input Unit with 8 or more input points and the outputs can be connected from a Transistor Output Unit with 8 or more output points.

Preparations

When using DSW(87), make the following setting in the PC Setup in PRO-GRAM mode before executing the program.

Digital Switch Settings (PC Setup)

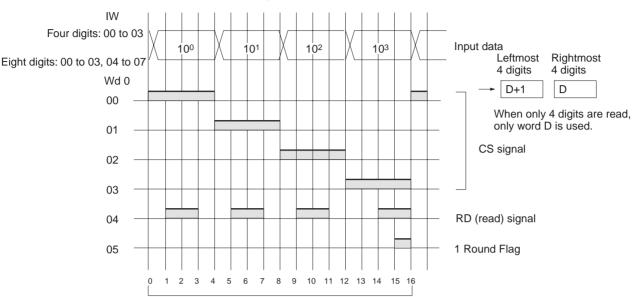

Do not make any changes to bits 0 to 7. They are not related to DSW(87).

Using the Instruction

 DSW(87)		
()		
	N	IW: I
01	N	OW:
	R	R: Fi

/: Input word W: Output word First register word

Section 2-2

If the input word for connecting the digital switch is specified at for IW, and the output word is specified for OW, then operation will proceed as shown below when the program is executed.

16 cycles to complete one round of execution

SR 25410 will turn ON while DSW(87) is being executed.

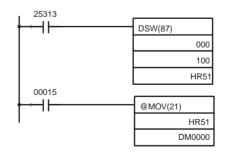

- **Note** 1. Do not use DSW(87) more than once within the same program.
 - 2. When using DSW(87), set the input constant for the relevant input word to less than the cycle time. (Input constants can be changed from DM 6620 onwards.) The characteristics of the digital switch must also be considered in system and program design.
 - 3. Input and output bits not used here can be used as ordinary input and output bits.

With this instruction, 4-digit or 8-digit set values can be read in 16 cycles.

Application Example This example shows a program for reading 4 digits in BCD from the digital switch. Assume that the digital switch is connected to IR 000 (input) and IR 100 (output), and assume the default status for all the PC Setup (4 digits to read).

The data set from the digital switch by DSW(87) is stored in HR 51.

When IR 00015 turns ON, the value stored in HR 51 is moved to DM 0001.

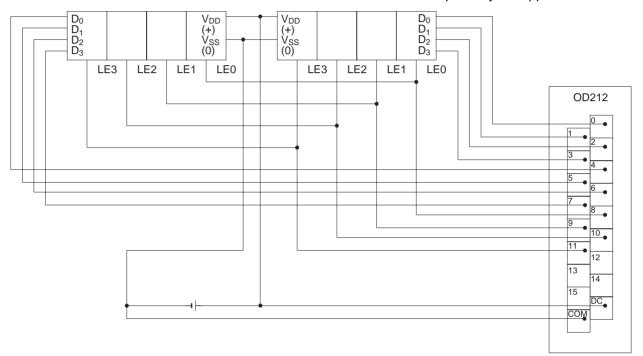

Note Output point 5 (here, IR 10005) turns on when one round of data is read and can be used to time switching the data storage area and gate signal (CS signal) when DSW(87) is used to input data to different areas of memory.

7-SEGMENT DISPLAY OUTPUT - 7SEG(88) 2-2-4

This instruction outputs word data to a 7-segment display. It utilizes either 8 (for 4 digits) or 12 (for 8 digits) output bits.

Hardware

The 7-segment display is connected to an Output Unit as shown in the diagram below. For 4-digit display, the data outputs (D0 to D3) are connected to output points 0 through 3, and latch outputs (CS0 to CS3) are connected to output points 4 through 7. Output point 12 (for 8-digit display) or output point 8 (for 4-digit display) will be turned ON when one round of data is displayed, but there is no need to connect them unless required by the application.

The outputs can be connected from a Transistor Output Unit with 8 or more output points for four digits or 16 or more output points for eight digits.

- Note Output Unit outputs normally employ negative logic. (Only the PNP output 1. type employs positive logic.)
 - 2. The 7-segment display may require either positive or negative logic, depending on the model.

Using the Instruction

7SEG(88)	
	S: First source word
S	O: Output word
0	C: Control data
С	

If the first word holding the data to be displayed is specified at S, and the output word is specified at O, and the SV taken from the table below is specified at C, then operation will proceed as shown below when the program is executed.

Data Storage Format

•	ormat
	Leftmost 4 digits

Rightmost 4 digits

S+1

- S

127

If only four digits are displayed, then only word S will be used.

Number of digits displayed	Display Unit data input and Output Unit logic	Display Unit latch input and Output Unit logic	C setting data
4 digits (4 digits, 1 block)	Same	Same	000
		Different	001
	Different	Same	002
		Different	003
8 digits (4 digits, 2 blocks)	Same	Same	004
		Different	005
	Different	Same	006
		Different	007

Set Values for Selecting Logic and Number of Digits (C)

Note Do not set C to values other than 000 to 007.

Function	Bit(s) in O	Output status (Data and latch logic depends on C)
	(4 digits, 1 block)	(4 digits, 2 blocks)	
Data output	to 03	to 03 to 07	Note 0 to 3: Data output for word S 4 to 7: Data output for word S+1
Latch output 0	04	08	
Latch output 1	05	09	
			1 2 3 4 5 6 7 8 9 10 11 12 1
			12 cycles required to complete one round

SR 25409 will turn ON while 7SEG(88) is being executed.

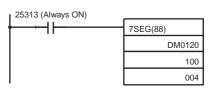

- Note
- 1. Do not use 7SEG(88) more than once within the same program.
 - 2. Consider the cycle time and the characteristics of the 7-segment display when designing the system.
 - 3. Output bits not used here can be used as ordinary output bits.

With this instruction, 4 digits or 8 digits are displayed in 12 cycles.

Operation will proceed from the first execution without regard to the status prior to execution.

Application Example

This example shows a program for displaying the CQM1's 8-digit BCD numbers at the 7-segment LED display. Assume that the 7-segment display is connected to output word IR 100. Also assume that the Output Unit is using negative logic, and that the 7-segment display logic is also negative for data signals and latch signals.

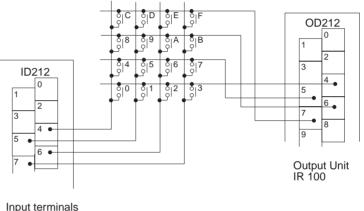

The 8-digit BCD data in DM 0120 (rightmost 4 digits) and DM 0121 (leftmost 4 digits) are always displayed by means of 7SEG(88). When the contents of DM 0120 and DM 0121 change, the display will also change.

2-2-5 Alternate I/O Bits

Although the advanced I/O instructions generally using I/O bits starting from bit 00 of the specified words, they can be programmed through intermediate words to use other I/O bits. The following example shows how this can be achieved for HKY(—).

Example The following wiring and program examples show how to use input bits IR 00004 through IR 00007 and output bits IR 10004 through IR 10007 to input values from a hexadecimal keypad.

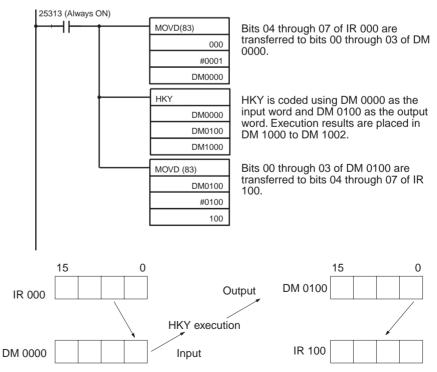

Wiring Diagram (Not Complete)

Input terminals IR 000

Note Power supply lines have been omitted.

Program

2-3 Macro Function

The macro function allows a single subroutine (programming pattern) to be used by simply changing the I/O word. A number of similar program sections can be managed with just one subroutine, thereby greatly reducing the number of steps in the program and making the program easier to understand.

Using Macros

To use a macro, call a subroutine by means of the MACRO instruction, MCRO(99), as shown below, in stead of SBS(91) (SUBROUTINE ENTRY).

 MCRO(99)
Subroutine No
Fist input word
First output word

When MCRO(99) is executed, operation will proceed as follows:

- The contents of the four consecutive words beginning with the first input word will be transferred to IR 096 through IR 099 (SR 232 through SR 235 in CPM1/CPM1A/SRM1 PCs). The contents of the four consecutive words beginning with the first output word will be transferred to IR 196 through IR 199 (SR 236 through SR 239 in CPM1, CPM1A and SRM1 PCs).
 - 2. The specified subroutine will be executed until RET(93) (Subroutine Return) is executed.
 - The contents of IR 196 through IR 199 (SR 236 through SR 239 in CPM1/ CPM1A/SRM1 PCs) will be transferred to the four consecutive words beginning with the first output word.
 - 4. MCRO(99) will then be finished.

When MCRO(99) is executed, the same instruction pattern can be used as needed simply by changing the first input word or the first output word.

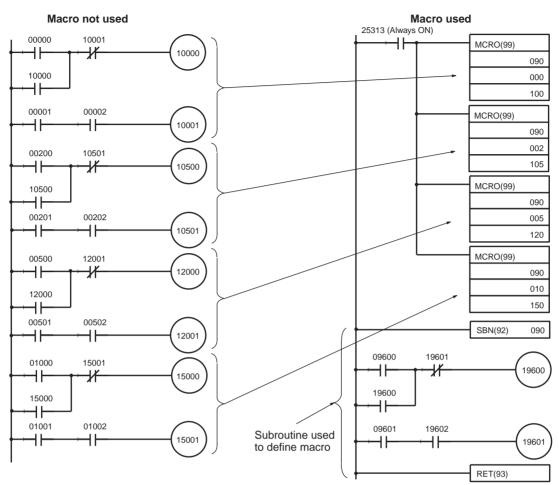

The following restrictions apply when the macro function is used.

- The only words that can be used for each execution of the macro are the four consecutive words beginning with the first input word number (for input) and the four consecutive words beginning with the first output word (for output).
- The specified inputs and outputs must correctly correspond to the words used in the subroutine.
- Even when the direct output method is used for outputs, subroutine results will be actually reflected in the specified output words only when the subroutine has been completed (step 3 above).
- Note 1. In CQM1 PCs, IR 096 to IR 099 and IR 196 to IR 199 can be used as work bits when MCRO(99) is not used.
 - 2. In CPM1/CPM1A/SRM1 PCs, SR 232 through SR 239 can be used as work bits when MCRO(99) is not used.

The first input word and the first output word can be specified not with I/O bits, but also with other bits (such as HR bits, work bits, etc.) or with DM words.

Subroutines called by MCRO(99) are defined by SBN(92) and RET(93), just as are ordinary subroutines.

When a macro is used, the program can be simplified as shown below.

CPM1/CPM1A/SRM1 Application Example The CPM1/CPM1A/SRM1 program can be simplified like the one shown above, but words SR 232 through SR 235 would be used instead of IR 096 through IR 099 and words SR 236 through SR 239 would be used instead of IR 196 through IR 199.

2-4 Differential Monitor

The CQM1/CPM1/CPM1A/SRM1 support differential monitoring from either the Programming Console or the SSS. The operator can detect on OFF-to-ON or ON-to-OFF transition in a specified bit. When the specified transition takes place, the transition is indicated on the display and a buzzer sounds to enable easy recognition of the transition.

Refer to the CQM1 Operation Manual, CPM1 Operation Manual, CPM1A Operation Manual or SRM1 Master Control Units Operation Manual for details on the Programming Console Differential Monitor procedure and to the SSS Operation Manual: C-series PCs for the SYSMAC Support Software procedure.

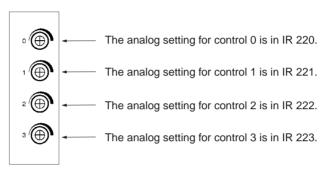

2-5 Analog Settings (CQM1-CPU42-EV1/CPM1/CPM1A Only)

In the CQM1-CPU42-EV1/CPM1/CPM1A PCs, the analog settings function automatically transfers the settings on the CPU Unit's adjustment switches to IR 220 through IR 223. This function is very useful when there are set values that need to be precisely adjusted during operation. These set values can be changed just by turning the adjustment switches on the CPU Unit.

Section 2-5

The adjustment settings are stored in BCD and range from 0000 to 0200. Use a precision screwdriver to adjust the settings. (Turn the switches clockwise to increase the adjustment.)

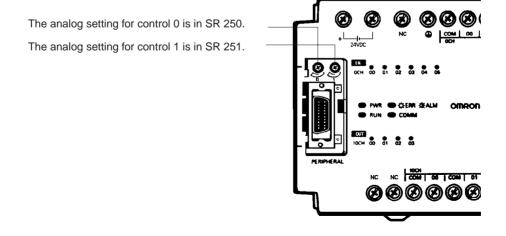

The CQM1-CPU42-EV1 has four analog adjustment controls. The following diagram shows the CQM1-CPU42-EV1 adjustment controls and indicates the corresponding IR words that contain the adjustment settings.

In CQM1 CPU Units other than the CQM1-CPU42-EV1, IR 220 through IR 223 serve no special purpose. They can be used as work words in the program.

Caution The CQM1-CPU42-EV1 continually refreshes IR 220 through IR 223 with the adjustment settings as long as the power is on. Do not overwrite the content of these words from the program or Peripheral Device.

CPM1/CPM1A Settings The CPM1/CPM1A PCs have two analog adjustment controls. The following diagram shows the adjustment controls and indicates the corresponding SR words that contain the adjustment settings. Use a phillips-head screwdriver to adjust the settings.

Note The above diagram shows the CPM1, but the settings are the same for CPM1A.

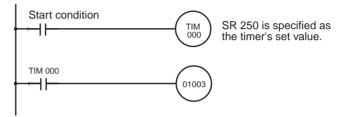

CQM1-CPU42-EV1 Settings

132

 \bigwedge Caution The analog setting may change with changing temperatures. Do not use the analog adjustment controls for applications that require a precise, fixed setting.

CPM1/CPM1A Program Example

The following ladder program uses the CPM1/CPM1A's analog settings. The analog setting in SR 250 (0000 to 0200 BCD) is determined by adjusting analog adjustment control 0. This value is used to adjust the timer's set value from 0.0 to 20.0 seconds.

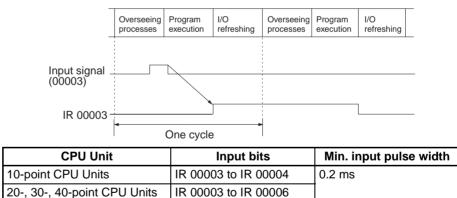

2-6 Quick-response Inputs (CPM1/CPM1A Only)

The CPM1/CPM1A have quick response inputs that can be used to enable inputting shorter signals.

All 10-point CPU Units have 2 quick-response input terminals and the 20-, 30-, and 40-point CPU Units have 4 guick-response input terminals. The same terminals are used for quick-response inputs and interrupt inputs.

Quick-response Operation Quick-response inputs have an internal buffer, so input signals shorter than one cycle can be detected. Signals with a pulse width as short as 0.2 ms can be detected, regardless of their timing during the PC cycle.

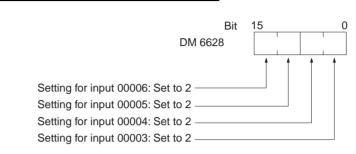

Setting Quick-response Inputs

The input bits in the above table can be set as quick-response inputs in DM 6628, as shown in the following table.

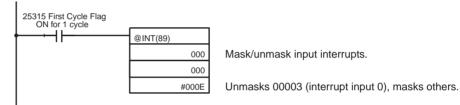

Section 2-6

Word	Settings
DM 6628	0: Normal input 1: Interrupt input 2: Quick-response input
	(Default setting: 0)

Program Example

In this example, DM 6628 has been set to 0002.

SECTION 3 Memory Areas

This section describes the structure of the PC memory areas, and explains how to use them. It also describes the CQM1 Memory Cassette operations used to transfer data between the CQM1 CPU Unit and a Memory Cassette.

3-1	CQM1	Memory Area Functions	136

3-1 CQM1 Memory Area Functions

3-1-1 Memory Area Structure

The following memory a	areas can be	used with the	CQM1.
------------------------	--------------	---------------	-------

Data area		Size	Words	Bits	Function
IR area ¹	Input area	128, or 256 bits	IR 000 to IR 015	IR 00000 to IR 01515	CQM1-CPU11/21-E: Up to 8 words (128 bits) can be used for I/O bits. Up to 7 Units can be connected.
	Output area		IR 100 to IR 115	IR 10000 to IR 11515	CQM1-CPU4□-EV1: Up to 16 words (256 bits) can be used for I/O bits. Up to 11 Units can be connected.
	Work areas	2,720	IR 016 to IR 095	IR 01600 to IR 09515	Work bits do not have any specific function,
		bits min. ²	IR 116 to IR 195	IR 11600 to IR 19515	and they can be freely used within the pro- gram.
			IR 216 to IR 219	IR 21600 to IR 21915	grann
			IR 224 to IR 229	IR 22400 to IR 22915	
MACRO operand	Input area	64 bits	IR 096 to IR 099	IR 09600 to IR 09915	Used when the MACRO instruction, MCRO(99), is used. When the MACRO
area ¹	Output area	64 bits	IR 196 to IR 199	IR 19600 to IR 19915	instruction is not used, these bits may be used as work bits.
Analog S	V area ¹	64 bits	IR 220 to IR 223	IR 22000 to IR 22315	CQM1-CPU42-EV1: Used to store the analog set values. (Cannot be used as work bits.) Can be used as work bits in other CPU Units.
High-spee PV ¹	ed Counter 0	32 bits	IR 230 to IR 231	IR 23000 to IR 23115	Used to store the present values of high- speed counter 0.
Port 1 and 2 Pulse Output PVs ¹		64 bits	IR 236 to IR 239	IR 23600 to IR 23915	CQM1-CPU43-EV1: Used to store the present values of pulse outputs for ports 1 and 2. (Cannot be used as work bits.)
					CQM1-CPU44-EV1: Used by the system. (Cannot be used as work bits.)
					Can be used as work bits in other CPU Units.
High-speed Counter 1 and 2 PVs ¹		64 bits	IR 232 to IR 235	IR 23200 to IR 23515	CQM1-CPU43/44-EV1: Used to store the present values of high- speed counters 1 and 2 for ports 1 and 2. (Cannot be used as work bits.)
					Can be used as work bits in other CPU Units.
Expansion Areas ¹		320 bits	IR 200 to IR 215 IR 240 to IR 243	IR 20000 to IR 21515 IR 24000 to IR 24315	These bits are expected to be used in planned function expansion.
SR area		184 bits	SR 244 to SR 255	SR 24400 to SR 25507	These bits serve specific functions such as flags and control bits.
					Can be used as work bits.
TR area		8 bits		TR 0 to TR 7	These bits are used to temporarily store ON/OFF status at program branches.
HR area		1,600 bits	HR 00 to HR 99	HR 0000 to HR 9915	These bits store data and retain their ON/ OFF status when power is turned off.
AR area		448 bits	AR 00 to AR 27	AR 0000 to AR 2715	These bits serve specific functions such as flags and control bits.
LR area ¹		1,024 bits	LR 00 to LR 63	LR 0000 to LR 6315	Used for 1:1 data link through the RS-232 port.
Timer/Counter area ³		512 bits	TC 000 to TC 511 bers)	(timer/counter num-	The same numbers are used for both timers and counters. TC 000 to TC 002 are used for interval timers.

Data area		Size	Words	Bits	Function
DM area	Read/write	1,024 words	DM 0000 to DM 1023		DM area data can be accessed in word units only. Word values are retained when the power is turned off.
		5,120 words	DM 1024 to DM 6143		Available in CQM1-CPU4□-EV1 CPU Units only. ⁴
	Read-only ⁵	425 words	DM 6144 to DM 6568		Cannot be overwritten from program.
	Error history area ⁵	31 words	DM 6569 to DM 6599		Used to store the time of occurrence and error code of errors that occur.
	PC Setup ⁵	56 words	DM 6600 to DM 6655		Used to store various parameters that con- trol PC operation.
User program area (UM area)		or			Used to store the program. Retained when the power is turned off.
		7,200 words			CQM1-CPU11/21-E: 3,200 words CQM1-CPU4□-EV1: 7,200 words

Note 1. IR and LR bits that are not used for their allocated functions can be used as work bits.

- 2. At least 2,720 bits can be used as work bits. The total number of bits that can be used depends on the configuration of the PC system.
- 3. When accessing a PV, TC numbers are used as word data; when accessing Completion Flags, they are used as bit data.
- Although the CQM1-CPU11-E and CQM1-CPU21-E do not support DM 1024 through DM 6143, an error will not occur if they are addressed. Any attempt to write to these words will have no effect and any reads will produce all zeros.
- 5. Data in DM 6144 to DM 6655 cannot be overwritten from the program.

3-1-2 IR Area

The functions of the IR area are explained below.

Input and Output Area IR area bits are allocated to terminals on Input Units and Output Units. They reflect the ON/OFF status of input and output signals. Input bits begin at IR 00000, and output bits begin at IR 10000. With the CQM1, only IR 00000 through IR 01515 can be used as input bits and only IR 10000 through IR 11515 can be used as output bits.

For information on allocating input and output bits, refer to page 142.

Note Input bits cannot be used in output instructions. Do not use the same output bit in more than one OUT and/or OUT NOT instruction, or the program will not execute properly.

Work AreasWith the CQM1-CPU11/21-E and CQM1-CPU41-EV1 CPU Units, any of the
bits between IR 001 and IR 243 not used for specific functions can be used as
work bits. There are a few exceptions with the CQM1-CPU42/43/44-EV1 CPU
Units, as shown in the following table.

CPU Unit	Bits Unavailable as Work Bits
CQM1-CPU42-EV1	IR 22000 to IR 22315
CQM1-CPU43/44-EV1	IR 23200 to IR 23915

The work bits can be used freely within the program. They can only be used within the program, however, and not for direct external I/O. Work bits are reset (i.e., turned OFF) when the CQM1 power supply is turned off or when operation begins or stops.

The bits in the ranges shown below have specific functions, but can still be used as work bits when their specific functions are not being used.

Range	Function
Range	runcion
IR 001 to IR 015	When allocated to Input Units, these bits serve as input bits.
IR 096 to IR 099	When the MACRO instruction is used, these bits serve as oper- and input bits.
IR 100 to IR 115	When allocated to Output Units, these bits serve as output bits.
IR 196 to IR 199	When the MACRO instruction is used, these bits serve as oper- and output bits.
IR 220 to IR 223	In the CQM1-CPU42-EV1, these bits serve to store the analog SV. They can be used as work bits in other CPU Units.
IR 230 to IR 231	When high-speed counter 0 is used, these bits are used to store its present value.
IR 232 to IR 235	In the CQM1-CPU43/44-EV1, these bits are used to store the present values for high-speed counters 1 and 2. They can be used as work bits in other CPU Units.
IR 236 to IR 239	In the CQM1-CPU43-EV1, these bits are used to store the present values for pulse outputs from ports 1 and 2. In the CQM1-CPU44-EV1, they are used by the system. They can be used as work bits in other CPU Units.

IR 200 to IR 215 and IR 240 to IR 243 will be used in future functions, but they can be used as work bits for the time being.

LR 00 to LR 63 are used as link bits, but they can also be used as work bits when not linked to another CQM1.

I/O Bit Allocation I/O words are allocated in order from the left, beginning with IR 001 for the Input Unit and IR100 for the Output Unit. The CPU Unit's input points are allocated to IR 000. Even if the Input Unit and Output Unit are mounted at random the input words and output words are in separate portions of the IR area.

One word is allocated even for 8-point I/O Units. Bit usage for 8-point I/O Units are shown in the following table.

Unit	Bits 0 to 7	Bits 8 to 15	
Input Unit	Input bits	Always OFF (0)	
Output Unit	Output bits	Work bits	

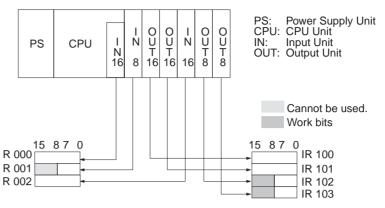

The number of I/O bits that can be allocated depends on the CQM1 CPU Unit being used, as shown in the following table.

CPU Unit model	Number of I/O bits
CQM1-CPU11/21-E	Up to 128 bits (8 words) can be used for I/O bits.
CQM1-CPU4□-EV1	Up to 265 bits (16 words) can be used for I/O bits.

As many as 256 I/O bits (16 words) can be allocated for the CQM1. A 16-point I/O Unit is allocated two words and must be counted as 16 points in calculating the total.

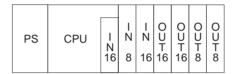

Note The SYSMAC-CPT will display or print only 12 I/O words in the I/O table display for the CQM1, i.e., IR 000 to IR 011. IR 012 to IR 015 will not be displayed for the CQM1-CPU4□-EV1 CPU Unit's I/O table, even though it has an I/O capacity of 256 pts (16 words). You will be able to input IR 012 to IR 015 for the CQM1-CPU4□-EV1 CPU Unit and the program will execute correctly for these bits, but "I" and "Q" will not be displayed to indicate input and output words/bits.

Word Allocation Example

All bits in words beyond the last input word and output word allocated can be used as work bits.

In order to make the word allocation easier to understand, and to help eliminate problems with noise, it is recommended that all Input Units be mounted directly following the CPU Unit. For the above example, the arrangement would be as shown below.

PS: Power Supply Unit CPU: CPU Unit IN: Input Unit OUT: Output Unit

The number of allocated input words is stored in BCD in AR 2200 to AR 2207; the number of allocated output words in BCD in AR 2208 to AR 2215. The CQM1 PCs do not use an I/O table.

Note Up to 11 I/O Units can be mounted, regardless of the CPU Unit.

3-1-3 SR Area

These bits mainly serve as flags related to CQM1 operation. For details on the various bit functions, refer to relevant sections in this manual or to *Appendix C Memory Areas*.

SR 244 to SR 247 can also be used as work bits, when input interrupts are not used in Counter Mode.

3-1-4 TR Area

When a complex ladder diagram cannot be programmed in mnemonic code just as it is, these bits are used to temporarily store ON/OFF execution conditions at program branches. They are used only for mnemonic code. When programming directly with ladder diagrams using the Ladder Support Software (LSS) or the SYSMAC Support Software (SSS), TR bits are automatically processed for you.

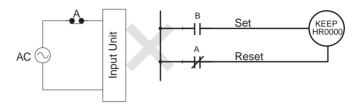

The same TR bits cannot be used more than once within the same instruction block, but can be used again in different instruction blocks. The ON/OFF status of TR bits cannot be monitored from a Peripheral Device.

Examples showing the use of TR bits in programming are provided on page 173.

3-1-5 HR Area

These bits retain their ON/OFF status even after the CQM1 power supply has been turned off or when operation begins or stops. They are used in the same way as work bits.

Caution Never use an input bit in a NC condition on the reset (R) for KEEP(11) when the input device uses an AC power supply (see diagram below). The delay in shutting down the PC's DC power supply relative to the AC power supply to the input device can cause the designate bit of KEEP(11) to be reset.

3-1-6 AR Area

These bits mainly serve as flags related to CQM1 operation. For details on the various bit functions, refer to relevant sections in this manual or to *Appendix C Memory Areas*.

With the exception of AR 23 (Power-off Counter), the status of AR words and bits is refreshed each cycle. (AR 23 is refreshed only for power interruptions.)

3-1-7 LR Area

When the CQM1 is linked one to one with another CQM1, these bits are used to share data. For details, refer to page 102.

LR bits can be used as work bits when not used for data links.

3-1-8 Timer/Counter Area

This area is used to manage timers and counters created with TIM, TIMH(15), CNT, and CNTR(12). The same numbers are used for both timers and counters and each number can be used only once in the user program. Do not use the same TC number twice even for different instructions.

TC number are used to create timers and counters, as well as to access Completion Flags and present values (PVs). If a TC number is designated for word data, it will access the present value (PV); if it is used for bit data, it access the Completion Flag for the timer/counter.

The Completion Flag turns ON when the PV of the timer/counter that is being used goes to 0.

Refer to instructions beginning on page 212 for details on timers and counters.

- TC numbers 000 through 015 and interrupt processing should be used for TIMH(15) whenever the cycle time is longer than 10 ms. Using other timer/ counter numbers or not using interrupt processing will lead to inaccuracy in the high-speed timers. Interrupt processing can be set in DM 6629 of the PC Setup.
 - When the input condition turns OFF for TIM or TIMH(15), the PV is reset and returns to the set value. The PV is also reset at the beginning of program execution or when the interlock condition goes OFF in a interlocked program section (IL–ILC). The PV for CNT or CNTR(12) is not reset like

one for the timer instruction, but rather is reset only when the reset input goes ON.

3-1-9 DM Area

Data is accessed in word units. As shown below, the DM area contains both an area that can be freely used and areas with specific functions.

DM0000		
DM1024		This area has no specific functions and can be used freely. Both reading and writing are possible from the program.
B1 1 1 1 1	(see note 1)	
DM6144	Fixed DM (see note 2)	This area cannot be written from the program. It is used for storing information that is not to be changed. Writing can be executed by means of peripheral devices only.
DM6600	Error Log	This area stores the error log. The user can only read this area, and cannot write into it.
DM6655	PC Setup (see note 2)	This area stores information related to CQM1 operation. The settings are made by means of peripheral devices.

- Note 1. The CQM1-CPU11-E and CQM1-CPU21-E do not support DM 1024 through DM 6143.
 - 2. Turning ON pin 1 of the DIP switch on the CPU Unit will prevent writing even by means of peripheral devices.

Fixed DM contents, the PC Setup, the user program, and the instructions table can all be saved to and loaded from a Memory Cassette as a single unit. Refer to page 149 for details.

Caution Although the CQM1-CPU11-E and CQM1-CPU21-E do not support DM 1024 through DM 6143, an error will not occur if they are addressed. Any attempt to write to these words will have no effect and any reads will produce all zeros.

3-1-10 UM Area

The UM area stores the user's program. UM area contents can be read and written only as program data, and not as words. The following table shows the size of the UM area in the CQM1 CPU Units.

CPU Unit Model	UM area size
CQM1-CPU11/21-E	3.2 KW
CQM1-CPU4□-EV1	7.2 KW

3-2 **CPM1/CPM1A Memory Area Functions**

Memory Area Structure 3-2-1

The following memor	y areas can be used with the CPM1/CPM1A.
The following memor	

Da	ta area	Words	Bits	Function
IR area ¹	Input area	IR 000 to IR 009 (10 words)	IR 00000 to IR 00915 (160 bits)	These bits can be allocated to the external I/O terminals.
	Output area	IR 010 to IR 019 (10 words)	IR 01000 to IR 01915 (160 bits)	
	Work area	IR 200 to IR 231 (32 words)	IR 20000 to IR 23115 (512 bits)	Work bits can be freely used within the pro- gram.
SR area		SR 232 to SR 255 (24 words)	SR 23200 to SR 25515 (384 bits)	These bits serve specific functions such as flags and control bits.
TR area			TR 0 to TR 7 (8 bits)	These bits are used to temporarily store ON/ OFF status at program branches.
HR area ²		HR 00 to HR 19 (20 words)	HR 0000 to HR 1915 (320 bits)	These bits store data and retain their ON/ OFF status when power is turned off.
AR area ² AR 00 to AR 15 (16 words)		AR 00 to AR 15 (16 words)	AR 0000 to AR 1515 (256 bits)	These bits serve specific functions such as flags and control bits.
LR area ¹		LR 00 to LR 15 (16 words)	LR 0000 to LR 1515 (256 bits)	Used for a 1:1 data link with another PC.
Timer/Cou	unter area ²	TC 000 to TC 127 (timer/counter numbers) ³		The same numbers are used for both timers and counters.
DM area	Read/write ²	DM 0000 to DM 0999 DM 1022 to DM 1023 (1,002 words)		DM area data can be accessed in word units only. Word values are retained when the power is turned off.
Error log		DM 1000 to DM 1021 (22 words)		Used to store the time of occurrence and error code of errors that occur. These words can be used as ordinary read/write DM when the error log function isn't being used.
	Read-only ⁴	DM 6144 to DM 6599 (456 words)		Cannot be overwritten from program.
	PC Setup ⁴	DM 6600 to DM 6655 (56 words)		Used to store various parameters that con- trol PC operation.

Note

1. IR and LR bits that are not used for their allocated functions can be used as work bits.

- 2. The contents of the HR area, LR area, Counter area, and read/write DM area are backed up by a capacitor. The backup time varies with the ambient temperature, but at 25°C, the capacitor will back up memory for 20 days. If the power supply is off longer than the backup time, memory contents will be cleared and AR1314 will turn ON. (This flag turns ON when data can no longer be retained by the built-in capacitor.) Refer to 2-1-2 Characteristics in the CPM1 and CPM1A Operation Manual for a graph showing the backup time vs. temperature.
- 3. When accessing a PV, TC numbers are used as word data; when accessing Completion Flags, they are used as bit data.
- 4. Data in DM 6144 to DM 6655 cannot be overwritten from the program, but they can be changed from a Peripheral Device.

3-2-2 IR Area

I/O Bits

The functions of the IR area are explained below.

IR area bits from IR 00000 to IR 01915 are allocated to terminals on the CPU Unit and I/O Units. They reflect the ON/OFF status of input and output signals. Input bits begin at IR 00000, and output bits begin at IR 01000.

The following table shows which IR bits are allocated to the I/O terminals on the CPM1 CPU Units and CPM1-20EDR I/O Unit.

CPM1 CPU Unit	I/O	CPU Unit Terminals	I/O Unit Terminals
CPM1-10CDR-	Inputs	6 points: 00000 to 00005	12 points: 00100 to 00111
	Outputs	4 points: 01000 to 01003	8 points: 01100 to 01107
CPM1-20CDR-	Inputs	12 points: 00000 to 00011	12 points: 00100 to 00111
	Outputs	8 points: 01000 to 01007	8 points: 01100 to 01107
CPM1-30CDR-	Inputs	18 points: 00000 to 00011, 00100 to 00105	12 points: 00200 to 00211
	Outputs	12 points: 01000 to 01007, 01100 to 01103	8 points: 01200 to 01207
CPM1-30CDR-⊡- V1	Inputs	18 points: 00000 to 00011, 00100 to 00105	36 points:00200 to 00211 00300 to 00311 00400 to 00411
	Outputs	12 points: 01000 to 01007, 01100 to 01103	24 points:01200 to 01207 01300 to 01407 01400 to 01407

The following table shows which IR bits are allocated to the I/O terminals on the CPM1A's CPU Units and Expansion I/O Unit.

Number	CPU Unit	CPM1A-20ED Expansion I/O Unit Terminals					Power	Model		
of I/O terminals on the CPU Unit	Inputs	Outputs	Inputs	Outputs	Inputs	Outputs	Inputs	Outputs	supply	number
10	6 points: 00000 to	4 points: 01000 to							AC	CPM1A- 10CD□-A
	00005	01003							DC	CPM1A- 10CD□-D
20	12 points: 00000 to	8 points: 01000 to							AC	CPM1A- 20CD□-A
	00011	01007							DC	CPM1A- 20CD□-D
30	18 points: 00000 to	12 points: 01000 to	12 points: 00200 to	8 points: 01200 to	12 points: 00300 to	8 points: 01300 to	12 points: 00400 to	8 points: 01400 to	AC	CPM1A- 30CD□-A
	00011 00100 to 00105	01007 01100 to 01103	00211	01207	00311	01307	00411	01407	DC	CPM1A- 30CD□-D

Work Bits

The work bits can be used freely within the program. They can only be used within the program, however, and not for direct external I/O.

3-2-3	SR Area	
		These bits mainly serve as flags related to CPM1/CPM1A operation or con- tain present and set values for various functions. For details on the various bit functions, refer to relevant sections in this manual or to <i>Appendix C Memory</i> <i>Areas</i> .
		SR 244 to SR 247 can also be used as work bits, when input interrupts are not used in Counter Mode.
3-2-4	TR Area	
		When a complex ladder diagram cannot be programmed in mnemonic code just as it is, these bits are used to temporarily store ON/OFF execution condi- tions at program branches. They are used only for mnemonic code. When programming directly with ladder diagrams using the Ladder Support Soft- ware (LSS) or the SYSMAC Support Software (SSS), TR bits are automati- cally processed for you.
		The same TR bits cannot be used more than once within the same instruction block, but can be used again in different instruction blocks. The ON/OFF status of TR bits cannot be monitored from a Peripheral Device.
		Examples showing the use of TR bits in programming are provided on page 173.
3-2-5	HR Area	
		These bits retain their ON/OFF status even after the CPM1/CPM1A power supply has been turned off or when operation begins or stops. They are used in the same way as work bits.
3-2-6	AR Area	
		These bits mainly serve as flags related to CPM1/CPM1A operation. These bits retain their status even after the CPM1/CPM1A power supply has been turned off or when operation begins or stops. For details on the various bit functions, refer to relevant sections in this manual or to <i>Appendix C Memory Areas</i> .
3-2-7	LR Area	
		When the CPM1/CPM1A is linked one-to-one with another CPM1/CPM1A, a CQM1, an SRM1 or a C200HS PC, these bits are used to share data. For details, refer to page 104.
		LR bits can be used as work bits when not used for data links.
3-2-8	Timer/Counte	er Area
		This area is used to manage timers and counters created with TIM, TIMH(15), CNT, and CNTR(12). The same numbers are used for both timers and counters and each number can be used only once in the user program. Do not use the same TC number twice even for different instructions.

TC numbers are used to create timers and counters, as well as to access Completion Flags and present values (PVs). If a TC number is designated for word data, it will access the present value (PV); if it is used for bit data, it will access the Completion Flag for the timer/counter.

Refer to instructions beginning on page 212 for details on timers and counters.

DM Area	
	DM area data is accessed in word units only. The contents of the DM area are retained even after the CPM1/CPM1A power supply has been turned off or when operation begins or stops.
	DM words DM 0000 through DM 0999, DM 1022, and DM 1023 can be used freely in the program; other DM words are allocated specific functions, described below.
9	DM 1000 through DM 1021 contain the error log information. Refer to SEC- TION 8 Troubleshooting for details on the error log.
)	DM 6600 through DM 6655 contain the PC Setup. Refer to 1-5 CQM1 Inter- rupt Functions for details.
	DM Area

3-3 SRM1 Memory Area Functions

3-3-1 Memory Area Structure

Da	ta area	Words	Bits	Function
IR area ¹	Input area	IR 000 to IR 009 (10 words)	IR 00000 to IR 00915 (160 bits)	These bits can be allocated to the external I/ O terminals. The ON/OFF status of the I/O bits will be the same as the ON/OFF status
	Output area	IR 010 to IR 019 (10 words)	IR 01000 to IR 01915 (160 bits)	of the I/O terminals Any I/O bits not used for I/O can be used as work bits.
	Work area	IR 200 to IR 239 (40 words)	IR 20000 to IR 23915 (640 bits)	Work bits can be freely used within the pro- gram. IR 232 to IR 239 however, cannot be used as the the MACRO input area for the MACRO instruction.
SR area		SR 240 to SR 255 (16 words)	SR 24000 to SR 25507 (248 bits)	These bits serve as storage space for flags and function set values/present values for SRM1 operation. Refer to <i>SR Area</i> .
TR area			TR 0 to TR 7 (8 bits)	When a complicated ladder diagram cannot be recorded as a mnemonic these bits are used to temporarily store ON/OFF status at program branches. These temporary bits cannot be used within the same block but if the blocks are different several may be used. The ON/OFF status of these bits cannot be monitored using the monitoring function of a peripheral device.
HR area ²		HR 00 to HR 19 (20 words)	HR 0000 to HR 1915 (320 bits)	These bits store data and retain their ON/ OFF status when power is turned off, or operation starts or stops. They are used in the same way as work bits.
AR area ²		AR 00 to AR 15 (16 words)	AR 0000 to AR 1515 (256 bits)	These bits serve specific functions such as flags and control bits. AR 04 to 07 are used as slaves. Refer to <i>AR Area</i> .
LR area ¹		LR 00 to LR 15 (16 words)	LR 0000 to LR 1515 (256 bits)	Used for a 1:1 data link with another SRM1, CQM1 or C200HS PC.

The following memory areas can be used with the SRM1.

Data area		Words	Bits	Function
Timer/Counter area ²		TC 000 to TC 127 (timer/counter numbers) ³		Timers and counter use the TIM, TIMH(15), CNT and CNTR(12) instructions. The same numbers are used for both timers and counters.
				Timer/counter numbers should be specified as bits when dealing with timer/counter present values. The counter data will be stored even when the SRM1 power is turned off or operation is stopped or started.
				When timer/counter are treated as up-flags the number should be specified as relay data.
DM area	Read/write ²	DM 0000 to DM 1999 (2,000 words)		DM area data can be accessed in word units only. Word values are retained when the power is turned off, or operation started or stopped.
				Read/write areas can be read and written freely within the program.
	Error log ⁴	DM 2000 to DM 2021 (22 words)		Used to store the time of occurrence and error code of errors that occur. Refer to 5-5 Coding Right-hand Instructions.
	Read-only ⁴	DM 6144 to DM 6599 (456 words)		Cannot be overwritten from program.
	PC Setup ⁴	DM 6600 to DM 6655 (56 words)		Used to store various parameters that con- trol PC operation.

Note 1. IR and LR bits that are not used for their allocated functions can be used as work bits.

- 2. The contents of the HR area, LR area, Counter area, and read/write DM area are backed up by a capacitor. At 25°C, the capacitor will back up memory for 20 days. Refer to 2-1-2 Characteristics in the SRM1 Master Control Unit Operation Manual for a graph showing the backup time vs. temperature.
- 3. When accessing a PV, TC numbers are used as word data; when accessing Completion Flags, they are used as bit data.
- 4. Data in DM 6144 to DM 6655 cannot be overwritten from the program, but they can be changed from a Peripheral Device.

3-3-2 IR Area

I/O Bits

The functions of the IR area are explained below.

IR area bits from IR 00000 to IR 01915 are allocated to terminals on the CPU Unit and I/O Unit. They reflect the ON/OFF status of input and output signals. Input bits begin at IR 00000, and output bits begin at IR 01000.

Refer to 1-4 I/O and Data Area Allocation in the SRM1 Master Control Units Operation Manual for further details.

Work BitsThe work bits can be used freely within the program. They can only be used
within the program, however, and not for direct external I/O.

3-3-3	SR Area	
		These bits mainly serve as flags related to SRM1 operation or contain present and set values for various functions. For details on the various bit functions, refer to relevant sections in this manual or to <i>Appendix C Memory Areas</i> . SR 240 to SR 247 and SR250, 251 can also be used as work bits, when input
		interrupts are not used in Counter Mode. SR232 to SR239 can also be used as work bits when the MCRO (99) instruction is not being used.
3-3-4	TR Area	
		When a complex ladder diagram cannot be programmed in mnemonic code just as it is, these bits are used to temporarily store ON/OFF execution condi- tions at program branches. They are used only for mnemonic code. When programming directly with ladder diagrams using the Ladder Support Soft- ware (LSS) or the SYSMAC Support Software (SSS), TR bits are automati- cally processed for you.
		The same TR bits cannot be used more than once within the same instruction block, but can be used again in different instruction blocks. The ON/OFF status of TR bits cannot be monitored from a Peripheral Device.
		Examples showing the use of TR bits in programming are provided on page 173.
3-3-5	HR Area	
		These bits retain their ON/OFF status even after the SRM1 power supply has been turned off or when operation begins or stops. They are used in the same way as work bits.
3-3-6	AR Area	
		These bits mainly serve as flags related to SRM1 operation. These bits retain their status even after the SRM1 power supply has been turned off or when operation begins or stops. For details on the various bit functions, refer to relevant sections in this manual or to <i>Appendix C Memory Areas</i> .
3-3-7	LR Area	
		When the SRM1 is linked one-to-one with another SRM1, a CQM1, an CPM1/ CPM1A or a C200HS PC, these bits are used to share data. For details, refer to page 104.
2 2 0	Timer/Count	LR bits can be used as work bits when not used for data links.
3-3-8	Timer/Count	
		This area is used to manage timers and counters created with TIM, TIMH(15), CNT, and CNTR(12). The same numbers are used for both timers and counters and each number can be used only once in the user program. Do not use the same TC number twice even for different instructions.

TC numbers are used to create timers and counters, as well as to access Completion Flags and present values (PVs). If a TC number is designated for word data, it will access the present value (PV); if it is used for bit data, it will access the Completion Flag for the timer/counter.

Refer to instructions beginning on page 212 for details on timers and counters.

3-3-9 DM Area			
	DM area data is accessed in word units only. The contents of the DM area are retained even after the SRM1 power supply has been turned off or when operation begins or stops.		
	DM words DM 0000 through DM 1999, DM 2022, and DM 2047 can be used freely in the program; other DM words are allocated specific functions, described below.		
Error Log	DM 2000 through DM 2021 contain the error log information. Refer to SEC- TION 8 Troubleshooting for details on the error log.		
PC Setup	DM 6600 through DM 6655 contain the PC Setup. Refer to SECTION 1 PC Setup and Other Features for details.		
3-4 SRM1 Flash	Memory		
	The following settings must be made to use the flash memory area for SRM1 PCs.		
Writing Data	In order to write the contents of the UM area, the DM read-only area (DM 6144 to DM 6599, and the PC Setup area (DM 6600 to DM 6655) to the flash memory, either one of the following operations must be performed.		
	Switch the SRM1 to either the MONITOR or PROGRAM mode.		
	 Turn the power to the SRM1 off and on again. 		
Note	If changes are made to the above memory areas, they are not written to the flash memory, and the power is switched off for 20 days or more (at 25°C), the changes (in RAM) will be lost. If this occurs, the unchanged contents will be read from the flash memory when the PC is started again.		
Changing Memory Areas	When operating the SRM1 for the first time after changes have been made to the UM area, the DM read only area (DM 6144 to DM 6599, and the PC Setup area (DM 6600 to DM 6655), beware of the effect resulting from the SRM1's delay in the operation on other devices.		
	The first operation for the SRM1 after the above memory areas have been changed will be a maximum of 850 ms later than the normal first operation without changes.		
Cycle Times	A cycle time overflow warning will not be issued when any of the following operations are performed in either MONITOR or OPERATION modes. Be careful of the effect of using online editing on SRM1 I/O response time.		
	Changes to the program using online editing.		
	 Changes to the read-only DM area (DM 6144 to DM 6599.) Changes to the PC Setup area (DM 6600 to DM 6655.) 		
	When any of the above operations are performed, the SRM1 cycle time will be		

When any of the above operations are performed, the SRM1 cycle time will be increased by a maximum of 850 ms. During this tiny interrupts will be disabled while the program or memory contents is written.

3-5 Using Memory Cassettes (CQM1 Only)

When the optional Memory Cassette is used, the PC Setup, user's program, fixed DM, and the instructions tabled can be placed in ROM. This prevents unwanted changes from being accidentally written. In addition, when changing control processes, the settings and the program can be easily changed by simply replacing the Memory Cassette.

This section explains how to read, write, and compare information to and from the Memory Cassette.

3-5-1 Memory Cassettes and Contents

Memory Cassettes

There are six types of Memory Cassette, as shown in the following table.

Model	Remarks	
CQM1-ME04K	EEPROM type (without clock) 4K words	
CQM1-ME04R	EEPROM type (with clock) 4K words	
CQM1-MP08K	EPROM type (without clock) 8K words	
CQM1-MP08R	EPROM type (with clock) 8K words	
CQM1-ME08K	EEPROM type (without clock) 8K words	
CQM1-ME08R	EEPROM type (with clock) 8K words	

The following EEPROM chips (sold separately) are required for EPROM-type Memory Cassettes.

Model	ROM version	Capacity	Access speed
ROM-ID-B	27128 or equivalent	8K words	150 ns
ROM-JD-B	27256 or equivalent	16K words	150 ns
ROM-KD-B	27512 or equivalent	32K words	150 ns

For the CQM1 CPU Units, 8K words max. of information can be written to the Memory Cassette. Therefore, any of the EPROM chips listed above would have sufficient capacity, and the choice can be made strictly on the basis of ease of purchase.

For instructions on using Memory Cassettes, refer to CQM1 Operation Manual.

Contents The information that can be written to a Memory Cassette is shown in the following table.

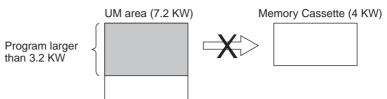

Information	Contents		
Fixed DM	Fixed Data Memory cannot be written from the pro- gram. The range is DM 6144 to DM 6568. These words are available for the user.		
PC Setup	The PC Setup sets the operating parameters of the CQM1 and it stored in DM 6600 to DM 6655.		
Instructions Table	The instructions table assigns expansion instruction to function codes to enable using them in programming.		
User Program Memory (UM)	The UM area holds the user's program.		

The above information is cannot be read, written, or compared individually, and must be treated as a single unit.

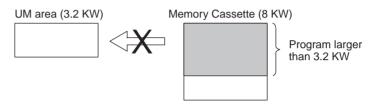

3-5-2 Memory Cassette Capacity and UM Area Size

A non-fatal error will occur if an attempt is made to transfer a program that is too large. There are two cases in which this can occur.

1,2,3... 1. When a 4-KW EEPROM Memory Cassette is installed in a CQM1-CPU4 EV1 CPU Unit with a 7.2-KW UM area, programs up to 3.2 KW long can be written to the Memory Cassette. A non-fatal error will occur if an attempt is made to write a program larger than 3.2 KW to the Memory Cassette.

 When a 8-KW or larger Memory Cassette is installed in a CQM1-CPU11/ 21-E CPU Unit with a 3.2-KW UM area, programs up to 3.2 KW long can be read from the Memory Cassette. A non-fatal error will occur if an attempt is made to read a program larger than 3.2 KW from the Memory Cassette.

Note The two transfers shown above would be completed normally if the program were 3.2 KW or smaller.

The approximate sizes of the programs in the UM area and Memory Cassette can be determined by the content of AR 15, as shown in the following table.

Program location	Bits	Content	Meaning
Memory Cassette	AR 1500 to AR 1507	00	No Memory Cassette is installed or no program is saved in the Memory Cassette.
		04	The program is less than 3.2 KW long and can be read from any CQM1 CPU Unit.
		08	The program is less than 7.2 KW long and can be read from CQM1-CPU4□-E/-EV1 CPU Units only.
UM area	AR 1508 to AR 1515	04	The program is less than 3.2 KW long and can be written to any Memory Cassette.
		08	The program is less than 7.2 KW long and can be written to 8-KW or larger Memory Cassettes only.

In CQM1-CPU11/21-E CPU Units, the content of AR 1508 to AR 1515 is normally 04, and the content of AR 1500 to AR 1507 is normally 04 when a 4-KW Memory Cassette is installed.

The size of the program indicated in AR 15 does not include the NOP(00) instructions after END(01), but will include any instructions other than NOP(00). Be sure to clear any unneeded instructions after END(01) to get an accurate measurement of the program's size.

3-5-3 Writing to the Memory Cassette

Writing to an EPROM-type Memory Cassette is executed using either the Ladder Support Software (LSS) or SYSMAC Support Software (SSS), and a PROM Writer. For instructions on using LSS, refer to the *LSS Operation Manual*. For instructions on using SSS, refer to the *SSS Operation Manual*: *C*-series PCs.

Follow the procedure outlined below for writing.

- Check to see that the write-protect switch on the Memory Cassette is OFF (i.e., writing enabled). If the switch is ON (i.e., writing not enabled), then turn the CQM1 power supply off and remove the Memory Cassette before changing the switch.
 - 2. Check to see that the CQM1 is in PROGRAM mode. If it is in either RUN or MONITOR mode, use the LSS/SSS to change the mode.
 - 3. Turn ON AR 1400 from the LSS/SSS. The information will be written from the CQM1 to the Memory Cassette.
 - 4. With the LSS/SSS, clear the forced-set status to turn OFF AR 1400, which will not change even after the operation is complete. (If the Programming Console is being used, AR 1400 will automatically turn OFF.)
- Caution Data cannot be written to the Memory Cassette if a memory error has occurred.
 - **Note** If an error occurs while data is being transmitted, a non-fatal error (FAL 9D) will be generated and the appropriate AR bit (from AR 1412 to AR 1415) will turn ON/OFF. If this occurs, refer to *SECTION 8 Troubleshooting* and make the necessary corrections.

3-5-4 Reading from the Memory Cassette

There are two methods for reading data from the Memory Cassette to the CQM1: By using a Peripheral Device (e.g., LSS/SSS) or by automatic reading the contents when the CQM1 is started up.

If the program on the Memory Cassette has expansion instructions with function codes different from the default settings, make sure that pin 4 of the CPU Unit's DIP switch is ON (indicating user-allocated function codes).

Note When data is being read from the Memory Cassette to the CQM1, pin 1 of the DIP switch on the CQM1 must be OFF (i.e., writing to the DM must be enabled). Turn off the power to the CQM1 before turning this pin OFF.

Reading from the Memory Cassette can be executed regardless of the type of Memory Cassette.

If an error occurs while data is being transmitted, a non-fatal error (FAL 9D) will be generated and the appropriate AR bit (from AR 1412 to AR 1415 will turn ON/OFF. (If this occurs, refer to the Troubleshooting section and make the necessary correction.)

Peripheral DeviceTo use a peripheral device to read from the Memory Cassette, follow the pro-
cedure outlined below.

- **1,2,3...** 1. Check to see that the CQM1 is in PROGRAM mode. If it is in either RUN or MONITOR mode, use the peripheral device to change the mode.
 - 2. Use the peripheral device to turn ON AR 1401. The information will be read from the Memory Cassette to the CQM1.
 - 3. With the LSS/SSS, clear the forced-set status to turn OFF AR 1401, which will not change even after the operation is complete. (If the Programming Console is being used, AR 1401 will automatically turn OFF.)
- Automatic Reading If pin 2 of the DIP switch on the CQM1 is turned ON (auto-boot), then data will automatically be read from the Memory Cassette when the power supply is turned on to the CQM1. Operation will not be possible if an error occurs during transfer of data between the Memory Cassette and CQM1 memory.

Caution Be absolutely sure that the power is turned off before changing CQM1 DIP switch settings.

3-5-5 Comparing Memory Cassette Contents

The contents of the Memory Cassette can be compared to the contents of the CQM1 memory to check to see if they are the same. This comparison can be performed for any type of Memory Cassette.

Use the following procedure.

- **1,2,3...** 1. Check to see that the CQM1 is in PROGRAM mode. If it is in either RUN or MONITOR mode, use the peripheral device to change to the PRO-GRAM mode.
 - 2. Turn ON AR 1402 from the peripheral device. The contents of the Memory Cassette will be compared to the contents of CQM1 memory.
 - 3. With the LSS/SSS, clear the forced-set status to turn OFF AR 1402, which will not change even after the operation is complete. (If the Programming Console is being used, AR 1402 will automatically turn OFF.)
 - 4. Check the status of AR 1403 to see the results of the comparison. AR 1403 will be ON if the contents were not the same or if the comparison was not possible because the CQM1 was not in PROGRAM mode. If AR 1403 is OFF, the comparison was successful and the contents were the same.

AR 1403 cannot be controlled from the program or from a peripheral device. It is controlled by the results of comparison only.

If a comparison is attempted with the CQM1 in any mode but PROGRAM mode, a non-fatal error will occur (FAL 9D) and AR 1412 will turn ON. Although AR 1403 will also turn ON, no comparison will have been performed. AR 1403 will also turn ON if a comparison is attempted without a Memory Cassette mounted in the CQM1.

3-6 Operation without a Battery

Operation is still possible when there is no internal battery, or the internal battery has expired, by writing the required data (user program, PC Setup, etc.) to a Memory Cassette. In this case, turn ON pin 2 on the DIP switch on the front of the CPU Unit so that data stored in the Memory Cassette is transferred to the CPU Unit automatically at startup.

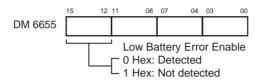

Note If the internal battery expires, the data in the CPU Unit (user program, settings, etc.) will be lost when the power is turned OFF.

Consider the following precautions when operating with no internal battery or with an expired battery.

- 1. When the internal battery expires, data will be affected in the following way.
 - HR area, Timer/Counter PVs, DM area, and AR area data will be unreliable when the power is turned OFF.
 - SR area data will become unstable when the power is turned OFF. Therefore, do not set the I/O Hold Bit (SR 25212) and the Forced Status Hold Bit (SR 25211) to be maintained in the PC Setup (DM 6601).
- 2. The I/O Hold Bit (SR 25212), the Forced Status Hold Bit (SR25211), and the Output OFF Bit (SR 25215) will be particularly unstable and may have an adverse effect on operation. Turn OFF these bits at the start of the program. The following instructions can be used to do this.

Note If the setting shown below is made in the PC Setup (DM 6655 bits 12 to 15), battery errors (a non-fatal error) will not be detected even if the internal battery expires.

SECTION 4 Ladder-diagram Programming

This section explains the basic steps and concepts involved in writing a basic ladder diagram program. It introduces the instructions that are used to build the basic structure of the ladder diagram and control its execution. The entire set of instructions used in programming is described in *SECTION 5 Instruction Set*.

4-1	Basic P	Procedure	156
4-2	Instruct	tion Terminology	156
4-3	Basic L	adder Diagrams	157
	4-3-1	Basic Terms	157
	4-3-2	Mnemonic Code	158
	4-3-3	Ladder Instructions	159
	4-3-4	OUTPUT and OUTPUT NOT	162
	4-3-5	The END Instruction	162
	4-3-6	Logic Block Instructions.	163
	4-3-7	Coding Multiple Right-hand Instructions	172
	4-3-8	Branching Instruction Lines	172
	4-3-9	Jumps	176
4-4	Control	lling Bit Status	177
	4-4-1	SET and RESET	177
	4-4-2	DIFFERENTIATE UP and DIFFERENTIATE DOWN	178
	4-4-3	КЕЕР	178
	4-4-4	Self-maintaining Bits (Seal)	179
4-5	Work E	Bits (Internal Relays)	179
4-6	Program	nming Precautions	181
4-7	Program	n Execution	183

4-1 Basic Procedure

There are several basic steps involved in writing a program. Sheets that can be copied to aid in programming are provided in *Appendix E I/O Assignment Sheet* and *Appendix F Program Coding Sheet*.

1,2,3...1. Obtain a list of all I/O devices and the I/O points that have been assigned to them and prepare a table that shows the I/O bit allocated to each I/O device.

- 2. If you are using LR bits to link two PCs, prepare sheet showing the used of these bits.
- 3. Determine what words are available for work bits and prepare a table in which you can allocate these as you use them.
- 4. Also prepare tables of TC numbers and jump numbers so that you can allocate these as you use them. Remember, the function of a TC number can be defined only once within the program; jump numbers 01 through 99 can be used only once each. (TC number are described in *5-15 Timer and Counter Instructions*; jump numbers are described later in this section.)
- 5. Draw the ladder diagram.
- 6. Input the program into the CPU Unit. When using the Programming Console, this will involve converting the program to mnemonic form.
- 7. Check the program for syntax errors and correct these.
- 8. Execute the program to check for execution errors and correct these.
- 9. After the entire Control System has been installed and is ready for use, execute the program and fine tune it if required.

The basics of ladder-diagram programming and conversion to mnemonic code are described in *4-3 Basic Ladder Diagrams*. Preparing for and inputting the program via the Programming Console are described in the *CQM1 Operation Manual*, *CPM1 Operation Manual*, the *CPM1A Operation Manual* and the *SRM1 Master Control Units Manual* and via the SSS in the SSS Operation Manual: C-series PCs.

The rest of SECTION 4 covers more advanced programming, programming precautions, and program execution. All special application instructions are covered in *SECTION 5 Instruction Set*. Debugging is described in the *CQM1 Operation Manual, CPM1 Operation Manual,* the *SRM1 Master Control Units Manual, and SSS Operation Manual: C-series PCs. SECTION 8 Troubleshooting* also provides information required for debugging.

4-2 Instruction Terminology

There are basically two types of instructions used in ladder-diagram programming: instructions that correspond to the conditions on the ladder diagram and are used in instruction form only when converting a program to mnemonic code and instructions that are used on the right side of the ladder diagram and are executed according to the conditions on the instruction lines leading to them.

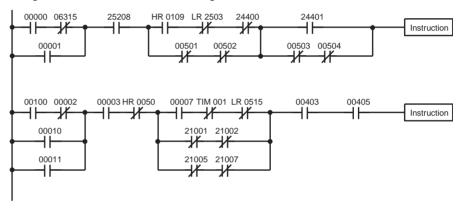

Most instructions have at least one or more operands associated with them. Operands indicate or provide the data on which an instruction is to be performed. These are sometimes input as the actual numeric values, but are usually the addresses of data area words or bits that contain the data to be used. For instance, a MOVE instruction that has IR 000 designated as the source operand will move the contents of IR 000 to some other location. The other

location is also designated as an operand. A bit whose address is designated as an operand is called an operand bit; a word whose address is designated as an operand is called an operand word. If the actual value is entered as a constant, it is preceded by # to indicate that it is not an address.

Other terms used in describing instructions are introduced in SECTION 5 Instruction Set.

4-3 Basic Ladder Diagrams

A ladder diagram consists of one line running down the left side with lines branching off to the right. The line on the left is called the bus bar; the branching lines, instruction lines or rungs. Along the instruction lines are placed conditions that lead to other instructions on the right side. The logical combinations of these conditions determine when and how the instructions at the right are executed. A ladder diagram is shown below.

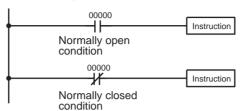

As shown in the diagram above, instruction lines can branch apart and they can join back together. The vertical pairs of lines are called conditions. Conditions without diagonal lines through them are called normally open conditions and correspond to a LOAD, AND, or OR instruction. The conditions with diagonal lines through them are called normally closed conditions and correspond to a LOAD NOT, or OR NOT instruction. The number above each condition indicates the operand bit for the instruction. It is the status of the bit associated with each condition that determines the execution condition for following instructions. The way the operation of each of the instructions corresponds to a condition is described below. Before we consider these, however, there are some basic terms that must be explained.

Note When displaying ladder diagrams with the SSS, a second bus bar will be shown on the right side of the ladder diagram and will be connected to all instructions on the right side. This does not change the ladder-diagram program in any functional sense. No conditions can be placed between the instructions on the right side and the right bus bar, i.e., all instructions on the right must be connected directly to the right bus bar. Refer to the SSS Operation Manual: C-series PCs for details.

4-3-1 Basic Terms

Normally Open and Normally Closed Conditions Each condition in a ladder diagram is either ON or OFF depending on the status of the operand bit that has been assigned to it. A normally open condition is ON if the operand bit is ON; OFF if the operand bit is OFF. A normally closed condition is ON if the operand bit is OFF; OFF if the operand bit is ON. Generally speaking, you use a normally open condition when you want something to happen when a bit is ON, and a normally closed condition when you want something to happen when a bit is OFF.

Instruction is executed when IR bit 00000 is ON.

Instruction is executed when IR bit 00000 is OFF.

Execution Conditions In ladder diagram programming, the logical combination of ON and OFF conditions before an instruction determines the compound condition under which the instruction is executed. This condition, which is either ON or OFF, is called the execution condition for the instruction. All instructions other than LOAD instructions have execution conditions.

Operand Bits The operands designated for any of the ladder instructions can be any bit in the IR, SR, HR, AR, LR, or TC areas. This means that the conditions in a ladder diagram can be determined by I/O bits, flags, work bits, timers/counters, etc. LOAD and OUTPUT instructions can also use TR area bits, but they do so only in special applications. Refer to *4-3-8 Branching Instruction Lines* for details.

Logic Blocks The way that conditions correspond to what instructions is determined by the relationship between the conditions within the instruction lines that connect them. Any group of conditions that go together to create a logic result is called a logic block. Although ladder diagrams can be written without actually analyzing individual logic blocks, understanding logic blocks is necessary for efficient programming and is essential when programs are to be input in mnemonic code.

Instruction Block An instruction block consists of all the instructions that are interconnected across the ladder diagram. One instruction block thus consists of all the instructions between where you can draw a horizontal line across the ladder diagram without intersecting any vertical lines and the next place where you can draw the same type of horizontal line.

4-3-2 Mnemonic Code

The ladder diagram cannot be directly input into the PC via a Programming Console; the SSS is required. To input from a Programming Console, it is necessary to convert the ladder diagram to mnemonic code. The mnemonic code provides exactly the same information as the ladder diagram, but in a form that can be typed directly into the PC. Actually you can program directly in mnemonic code, although it in not recommended for beginners or for complex programs. Also, regardless of the Programming Device used, the program is stored in memory in mnemonic form, making it important to understand mnemonic code.

Because of the importance of the Programming Console as a peripheral device and because of the importance of mnemonic code in complete understanding of a program, we will introduce and describe the mnemonic code along with the ladder diagram. Remember, you will not need to use the mnemonic code if you are inputting via the SSS (although you can use it with the SSS if you prefer).

Program Memory
StructureThe program is input into addresses in Program Memory. Addresses in Program Memory are slightly different to those in other memory areas because
each address does not necessarily hold the same amount of data. Rather,

each address holds one instruction and all of the definers and operands (described in more detail later) required for that instruction. Because some instructions require no operands, while others require up to three operands, Program Memory addresses can be from one to four words long.

Program Memory addresses start at 00000 and run until the capacity of Program Memory has been exhausted. The first word at each address defines the instruction. Any definers used by the instruction are also contained in the first word. Also, if an instruction requires only a single bit operand (with no definer), the bit operand is also programmed on the same line as the instruction. The rest of the words required by an instruction contain the operands that specify what data is to be used. When converting to mnemonic code, all but ladder diagram instructions are written in the same form, one word to a line, just as they appear in the ladder diagram symbols. An example of mnemonic code is shown below. The instructions used in it are described later in the manual.

Address	Instruction	Operands	
00000	LD	HR	0001
00001	AND		00001
00002	OR		00002
00003	LD NOT		00100
00004	AND		00101
00005	AND LD		
00006	MOV(21)		
			000
		DM	0000
00007	CMP(20)		
		DM	0000
		HR	00
00008	AND		25505
00009	OUT		10000
00010	MOV(21)		
		DM	0000
		DM	0500
00011	LD		00502
00012	AND		00005
00013	OUT		10003

The address and instruction columns of the mnemonic code table are filled in for the instruction word only. For all other lines, the left two columns are left blank. If the instruction requires no definer or bit operand, the operand column is left blank for first line. It is a good idea to cross through any blank data column spaces (for all instruction words that do not require data) so that the data column can be quickly scanned to see if any addresses have been left out.

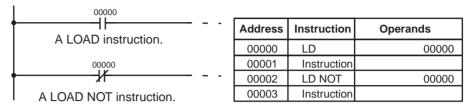

When programming, addresses are automatically displayed and do not have to be input unless for some reason a different location is desired for the instruction. When converting to mnemonic code, it is best to start at Program Memory address 00000 unless there is a specific reason for starting elsewhere.

4-3-3 Ladder Instructions

The ladder instructions are those instructions that correspond to the conditions on the ladder diagram. Ladder instructions, either independently or in combination with the logic block instructions described next, form the execution conditions upon which the execution of all other instructions are based.

LOAD and LOAD NOT

The first condition that starts any logic block within a ladder diagram corresponds to a LOAD or LOAD NOT instruction. Each of these instruction requires one line of mnemonic code. "Instruction" is used as a dummy instruction in the following examples and could be any of the right-hand instructions described later in this manual.

When this is the only condition on the instruction line, the execution condition for the instruction at the right is ON when the condition is ON. For the LOAD instruction (i.e., a normally open condition), the execution condition would be ON when IR 00000 was ON; for the LOAD NOT instruction (i.e., a normally closed condition), it would be ON when 00000 was OFF.

AND and AND NOT When two or more conditions lie in series on the same instruction line, the first one corresponds to a LOAD or LOAD NOT instruction; and the rest of the conditions, to AND or AND NOT instructions. The following example shows three conditions which correspond in order from the left to a LOAD, an AND NOT, and an AND instruction. Again, each of these instructions requires one line of mnemonic code.

Address	Instruction	Operands
00000	LD	00000
00001	AND NOT	00100
00002	AND	LR 0000
00003	Instruction	

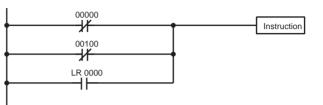

The instruction would have an ON execution condition only when all three conditions are ON, i.e., when IR 00000 was ON, IR 00100 was OFF, and LR 0000 was ON.

AND instructions in series can be considered individually, with each taking the logical AND of the execution condition (i.e., the total of all conditions up to that point) and the status of the AND instruction's operand bit. If both of these are ON, an ON execution condition will be produced for the next instruction. If either is OFF, the result will also be OFF. The execution condition for the first AND instruction in a series is the first condition on the instruction line.

Each AND NOT instruction in a series would take the logical AND between its execution condition and the inverse of its operand bit.

When two or more conditions lie on separate instruction lines running in parallel and then joining together, the first condition corresponds to a LOAD or LOAD NOT instruction; the rest of the conditions correspond to OR or OR NOT instructions. The following example shows three conditions which correspond in order from the top to a LOAD NOT, an OR NOT, and an OR instruction. Again, each of these instructions requires one line of mnemonic code.

Section 4-3

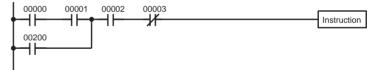

Address	Instruction		Operands
00000	LD NOT		00000
00001	OR NOT		00100
00002	OR	LR	0000
00003	Instruction		

The instruction would have an ON execution condition when any one of the three conditions was ON, i.e., when IR 00000 was OFF, when IR 00100 was OFF, or when LR 0000 was ON.

OR and OR NOT instructions can be considered individually, each taking the logical OR between its execution condition and the status of the OR instruction's operand bit. If either one of these were ON, an ON execution condition would be produced for the next instruction.

When AND and OR instructions are combined in more complicated diagrams, they can sometimes be considered individually, with each instruction performing a logic operation on the execution condition and the status of the operand bit. The following is one example. Study this example until you are convinced that the mnemonic code follows the same logic flow as the ladder diagram.

Address	Instruction	Operands
00000	LD	00000
00001	AND	00001
00002	OR	00200
00003	AND	00002
00004	AND NOT	00003
00005	Instruction	

Here, an AND is taken between the status of IR 00000 and that of IR 00001 to determine the execution condition for an OR with the status of IR 00200. The result of this operation determines the execution condition for an AND with the status of IR 00002, which in turn determines the execution condition for an AND with the inverse (i.e., and AND NOT) of the status of IR 00003.

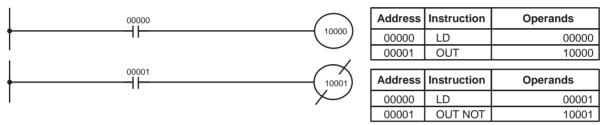

In more complicated diagrams, however, it is necessary to consider logic blocks before an execution condition can be determined for the final instruction, and that's where AND LOAD and OR LOAD instructions are used. Before

Combining AND and OR Instructions

we consider more complicated diagrams, however, we'll look at the instructions required to complete a simple "input-output" program.

4-3-4 OUTPUT and OUTPUT NOT

The simplest way to output the results of combining execution conditions is to output it directly with the OUTPUT and OUTPUT NOT. These instructions are used to control the status of the designated operand bit according to the execution condition. With the OUTPUT instruction, the operand bit will be turned ON as long as the execution condition is ON and will be turned OFF as long as the execution condition is OFF. With the OUTPUT NOT instruction, the operand bit will be turned ON as long as the execution condition is OFF. With the OUTPUT NOT instruction, the operand bit will be turned ON as long as the execution condition is OFF and turned OFF as long as the execution condition is ON. These appear as shown below. In mnemonic code, each of these instructions requires one line.

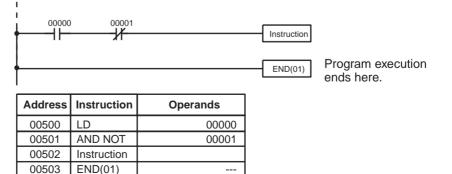

In the above examples, IR 10000 will be ON as long as IR 00000 is ON and IR 10001 will be OFF as long as IR 00001 is ON. Here, IR 00000 and IR 00001 would be input bits and IR 10000 and IR 10001 output bits assigned to the Units controlled by the PC, i.e., the signals coming in through the input points assigned IR 00000 and IR 00001 are controlling the output points assigned IR 10001, respectively.

The length of time that a bit is ON or OFF can be controlled by combining the OUTPUT or OUTPUT NOT instruction with Timer instructions. Refer to Examples under *5-15-1 TIMER – TIM* for details.

4-3-5 The END Instruction

The last instruction required to complete a simple program is the END instruction. When the CPU Unit scans the program, it executes all instructions up to the first END instruction before returning to the beginning of the program and beginning execution again. Although an END instruction can be placed at any point in a program, which is sometimes done when debugging, no instructions past the first END instruction will be executed until it is removed. The number following the END instruction in the mnemonic code is its function code, which is used when inputted most instruction into the PC. These are described later. The END instruction requires no operands and no conditions can be placed on the same instruction line with it.

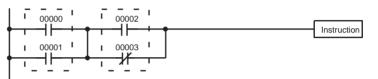

If there is no END instruction anywhere in the program, the program will not be executed at all.

Now you have all of the instructions required to write simple input-output programs. Before we finish with ladder diagram basic and go onto inputting the program into the PC, let's look at logic block instruction (AND LOAD and OR LOAD), which are sometimes necessary even with simple diagrams.

4-3-6 Logic Block Instructions

Logic block instructions do not correspond to specific conditions on the ladder diagram; rather, they describe relationships between logic blocks. The AND LOAD instruction logically ANDs the execution conditions produced by two logic blocks. The OR LOAD instruction logically ORs the execution conditions produced by two logic blocks.

AND LOAD Although simple in appearance, the diagram below requires an AND LOAD instruction.

Address	Instruction	Operands
00000	LD	00000
00001	OR	00001
00002	LD	00002
00003	OR NOT	00003
00004	AND LD	

The two logic blocks are indicated by dotted lines. Studying this example shows that an ON execution condition will be produced when: either of the conditions in the left logic block is ON (i.e., when either IR 00000 or IR 00001 is ON), **and** when either of the conditions in the right logic block is ON (i.e., when either IR 00002 is ON or IR 00003 is OFF).

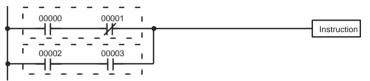

The above ladder diagram cannot, however, be converted to mnemonic code using AND and OR instructions alone. If an AND between IR 00002 and the results of an OR between IR 00000 and IR 00001 is attempted, the OR NOT between IR 00002 and IR 00003 is lost and the OR NOT ends up being an OR NOT between just IR 00003 and the result of an AND between IR 00002 and the first OR. What we need is a way to do the OR (NOT)'s independently and then combine the results.

To do this, we can use the LOAD or LOAD NOT instruction in the middle of an instruction line. When LOAD or LOAD NOT is executed in this way, the current execution condition is saved in special buffers and the logic process is begun over. To combine the results of the current execution condition with that of a previous "unused" execution condition, an AND LOAD or an OR LOAD instruction is used. Here "LOAD" refers to loading the last unused execution condition. An unused execution condition is produced by using the LOAD or LOAD NOT instruction for any but the first condition on an instruction line.

Analyzing the above ladder diagram in terms of mnemonic instructions, the condition for IR 00000 is a LOAD instruction and the condition below it is an OR instruction between the status of IR 00000 and that of IR 00001. The condition at IR 00002 is another LOAD instruction and the condition below is an OR NOT instruction, i.e., an OR between the status of IR 00002 and the inverse of the status of IR 00003. To arrive at the execution condition for the

instruction at the right, the logical AND of the execution conditions resulting from these two blocks would have to be taken. AND LOAD does this. The mnemonic code for the ladder diagram is shown below. The AND LOAD instruction requires no operands of its own, because it operates on previously determined execution conditions. Here too, dashes are used to indicate that no operands needs designated or input.

The following diagram requires an OR LOAD instruction between the top logic block and the bottom logic block. An ON execution condition would be produced for the instruction at the right either when IR 00000 is ON and IR 00001 is OFF or when IR 00002 and IR 00003 are both ON. The operation of and mnemonic code for the OR LOAD instruction is exactly the same as those for a AND LOAD instruction except that the current execution condition is ORed with the last unused execution condition.

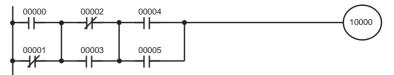

Address	Instruction	Operands
00000	LD	00000
00001	AND NOT	00001
00002	LD	00002
00003	AND	00003
00004	OR LD	

Naturally, some diagrams will require both AND LOAD and OR LOAD instructions.

Logic Block Instructions To code diagrams with logic block instructions in series, the diagram must be in Series divided into logic blocks. Each block is coded using a LOAD instruction to code the first condition, and then AND LOAD or OR LOAD is used to logically combine the blocks. With both AND LOAD and OR LOAD there are two ways to achieve this. One is to code the logic block instruction after the first two blocks and then after each additional block. The other is to code all of the blocks to be combined, starting each block with LOAD or LOAD NOT, and then to code the logic block instructions which combine them. In this case, the instructions for the last pair of blocks should be combined first, and then each preceding block should be combined, working progressively back to the first block. Although either of these methods will produce exactly the same result, the second method, that of coding all logic block instructions together, can be used only if eight or fewer blocks are being combined, i.e., if seven or fewer logic block instructions are required.

> The following diagram requires AND LOAD to be converted to mnemonic code because three pairs of parallel conditions lie in series. The two means of coding the programs are also shown.

OR LOAD

Address	Instruction	Operands	Address	Instruction	Operands
00000	LD	00000	00000	LD	00000
00001	OR NOT	00001	00001	OR NOT	00001
00002	LD NOT	00002	00002	LD NOT	00002
00003	OR	00003	00003	OR	00003
00004	AND LD	_	00004	LD	00004
00005	LD	00004	00005	OR	00005
00006	OR	00005	00006	AND LD	_
00007	AND LD	_	00007	AND LD	_
00008	OUT	10000	80000	OUT	10000

Again, with the method on the right, a maximum of eight blocks can be combined. There is no limit to the number of blocks that can be combined with the first method.

The following diagram requires OR LOAD instructions to be converted to mnemonic code because three pairs of conditions in series lie in parallel to each other.

The first of each pair of conditions is converted to LOAD with the assigned bit operand and then ANDed with the other condition. The first two blocks can be coded first, followed by OR LOAD, the last block, and another OR LOAD, or the three blocks can be coded first followed by two OR LOADs. The mnemonic code for both methods is shown below.

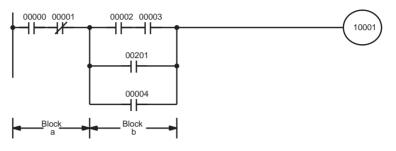

Address	Instruction	Operands	Address	Instruction	Operands
00000	LD	00000	00000	LD	00000
00001	AND NOT	00001	00001	AND NOT	00001
00002	LD NOT	00002	00002	LD NOT	00002
00003	AND NOT	00003	00003	AND NOT	00003
00004	OR LD	—	00004	LD	00004
00005	LD	00004	00005	AND	00005
00006	AND	00005	00006	OR LD	—
00007	OR LD	_	00007	OR LD	_
00008	OUT	10000	00008	OUT	10000

Again, with the method on the right, a maximum of eight blocks can be combined. There is no limit to the number of blocks that can be combined with the first method.

Combining AND LOAD and OR LOAD

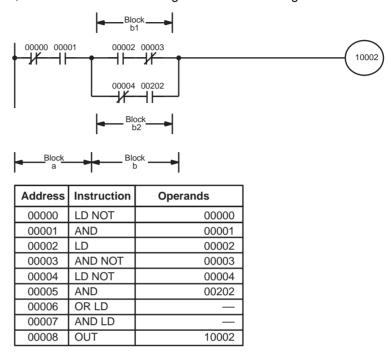

Both of the coding methods described above can also be used when using AND LOAD and OR LOAD, as long as the number of blocks being combined does not exceed eight.

The following diagram contains only two logic blocks as shown. It is not necessary to further separate block b components, because it can coded directly using only AND and OR.

Address	Instruction	Operands
00000	LD	00000
00001	AND NOT	00001
00002	LD	00002
00003	AND	00003
00004	OR	00201
00005	OR	00004
00006	AND LD	_
00007	OUT	10001

Although the following diagram is similar to the one above, block b in the diagram below cannot be coded without separating it into two blocks combined with OR LOAD. In this example, the three blocks have been coded first and then OR LOAD has been used to combine the last two blocks followed by AND LOAD to combine the execution condition produced by the OR LOAD with the execution condition of block a. When coding the logic block instructions together at the end of the logic blocks they are combining, they must, as shown below, be coded in reverse order, i.e., the logic block instruction for the last two blocks is coded first, followed by the one to combine the execution condition resulting from the first logic block instruction and the execution condition of the logic block third from the end, and on back to the first logic block that is being combined.

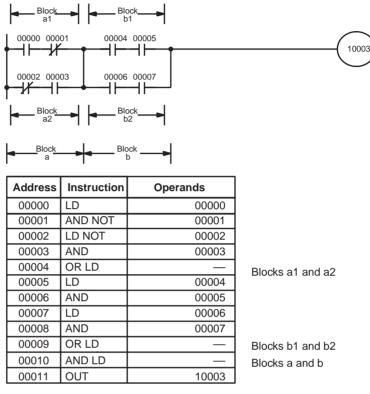

Complicated Diagrams

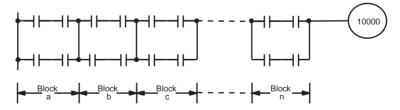

When determining what logic block instructions will be required to code a diagram, it is sometimes necessary to break the diagram into large blocks and then continue breaking the large blocks down until logic blocks that can be coded without logic block instructions have been formed. These blocks are then coded, combining the small blocks first, and then combining the larger blocks. Either AND LOAD or OR LOAD is used to combine the blocks, i.e., AND LOAD or OR LOAD always combines the last two execution conditions that existed, regardless of whether the execution conditions resulted from a single condition, from logic blocks, or from previous logic block instructions.

When working with complicated diagrams, blocks will ultimately be coded starting at the top left and moving down before moving across. This will generally mean that, when there might be a choice, OR LOAD will be coded before AND LOAD.

The following diagram must be broken down into two blocks and each of these then broken into two blocks before it can be coded. As shown below, blocks a and b require an AND LOAD. Before AND LOAD can be used, however, OR LOAD must be used to combine the top and bottom blocks on both sides, i.e., to combine a1 and a2; b1 and b2.

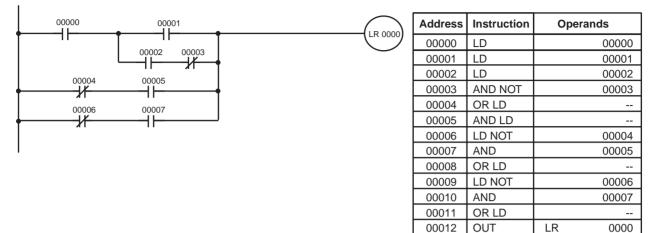

The following type of diagram can be coded easily if each block is coded in order: first top to bottom and then left to right. In the following diagram, blocks a and b would be combined using AND LOAD as shown above, and then block c would be coded and a second AND LOAD would be used to combined it with the execution condition from the first AND LOAD. Then block d would be coded, a third AND LOAD would be used to combine the execution condition from block d with the execution condition from the second AND LOAD, and so on through to block n.

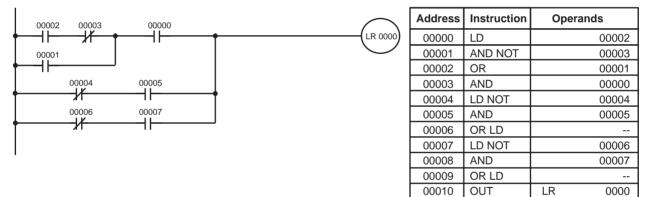

Basic Ladder Diagrams

Section 4-3

The following diagram requires an OR LOAD followed by an AND LOAD to code the top of the three blocks, and then two more OR LOADs to complete the mnemonic code.

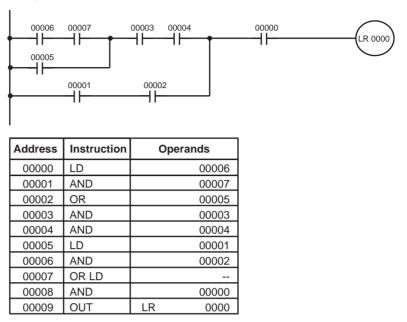

Although the program will execute as written, this diagram could be drawn as shown below to eliminate the need for the first OR LOAD and the AND LOAD, simplifying the program and saving memory space.

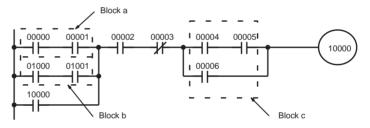

The following diagram requires five blocks, which here are coded in order before using OR LOAD and AND LOAD to combine them starting from the last two blocks and working backward. The OR LOAD at program address 00008 combines blocks blocks d and e, the following AND LOAD combines the resulting execution condition with that of block c, etc.

00000 00001 00002	\frown	Address	Instruction	Operands
	(LR 0000)	00000	LD	00000
Block b ——•	\smile	00001	LD	00001
Block a		00002	AND	00002
Block c — Block d —		00003	LD	00003
		00004	AND	00004
		00005	LD	00005
		00006	LD	00006
		00007	AND	00007
		80000	OR LD	
	Blocks d and e	00009	AND LD	
Block e	Block c with result of above	00010	OR LD	
	Block b with result of above	00011	AND LD	
	Block a with result of above	00012	OUT	LR 0000

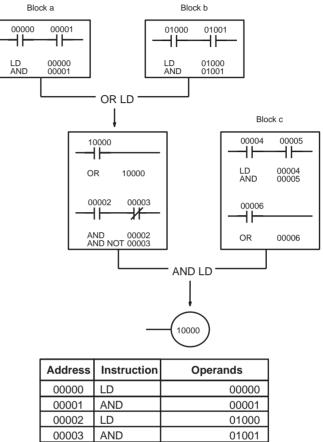

Again, this diagram can be redrawn as follows to simplify program structure and coding and to save memory space.

The next and final example may at first appear very complicated but can be coded using only two logic block instructions. The diagram appears as follows:

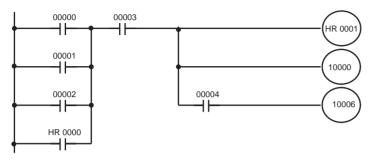

The first logic block instruction is used to combine the execution conditions resulting from blocks a and b, and the second one is to combine the execution condition of block c with the execution condition resulting from the normally closed condition assigned IR 00003. The rest of the diagram can be coded with OR, AND, and AND NOT instructions. The logical flow for this and the resulting code are shown below.

00000	7.110	01001	
00004	OR LD		
00005	OR	10000	
00006	AND	00002	
00007	AND NOT	00003	
80000	LD	00004	
00009	AND	00005	
00010	OR	00006	
00011	AND LD		
00012	OUT	10000	

4-3-7 **Coding Multiple Right-hand Instructions**

If there is more than one right-hand instruction executed with the same execution condition, they are coded consecutively following the last condition on the instruction line. In the following example, the last instruction line contains one more condition that corresponds to an AND with IR 00004.

Address	Instruction	Operan	ds
00000	LD		00000
00001	OR		00001
00002	OR		00002
00003	OR	HR	0000
00004	AND		00003
00005	OUT	HR	0001
00006	OUT		10000
00007	AND		00004
00008	OUT		10006

4-3-8 **Branching Instruction Lines**

When an instruction line branches into two or more lines, it is sometimes necessary to use either interlocks or TR bits to maintain the execution condition that existed at a branching point. This is because instruction lines are executed across to a right-hand instruction before returning to the branching point to execute instructions one a branch line. If a condition exists on any of the instruction lines after the branching point, the execution condition could change during this time making proper execution impossible. The following diagrams illustrate this. In both diagrams, instruction 1 is executed before returning to the branching point and moving on to the branch line leading to instruction 2.

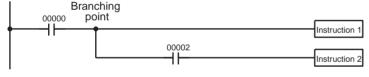

Diagram A: Correct Operation

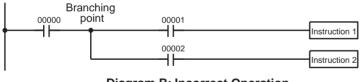

Diagram B: Incorrect Operation

Address	Instruction	Operands
00000	LD	00000
00001	Instruction 1	
00002	AND	00002
00003	Instruction 2	

Address	Instruction	Operands
00000	LD	00000
00001	AND	00001
00002	Instruction 1	
00003	AND	00002
00004	Instruction 2	

If, as shown in diagram A, the execution condition that existed at the branching point cannot be changed before returning to the branch line (instructions at the far right do not change the execution condition), then the branch line will be executed correctly and no special programming measure is required.

If, as shown in diagram B, a condition exists between the branching point and the last instruction on the top instruction line, the execution condition at the branching point and the execution condition after completing the top instruction line will sometimes be different, making it impossible to ensure correct execution of the branch line.

There are two means of programming branching programs to preserve the execution condition. One is to use TR bits; the other, to use interlocks (IL(02)/IL(03)).

TR Bits The TR area provides eight bits, TR 0 through TR 7, that can be used to temporarily preserve execution conditions. If a TR bit is placed at a branching point, the current execution condition will be stored at the designated TR bit. When returning to the branching point, the TR bit restores the execution status that was saved when the branching point was first reached in program execution.

The previous diagram B can be written as shown below to ensure correct execution. In mnemonic code, the execution condition is stored at the branching point using the TR bit as the operand of the OUTPUT instruction. This execution condition is then restored after executing the right-hand instruction by using the same TR bit as the operand of a LOAD instruction

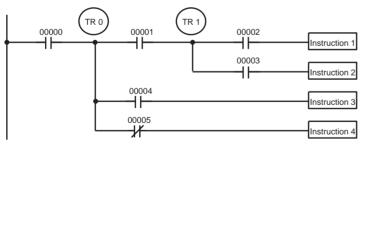

Diagram B: Corrected Using a TR bit

Address	Instruction	Ор	erands
00000	LD		00000
00001	OUT	TR	0
00002	AND		00001
00003	Instruction 1		
00004	LD	TR	0
00005	AND		00002
00006	Instruction 2		

In terms of actual instructions the above diagram would be as follows: The status of IR 00000 is loaded (a LOAD instruction) to establish the initial execution condition. This execution condition is then output using an OUTPUT instruction to TR 0 to store the execution condition at the branching point. The execution condition is then ANDed with the status of IR 00001 and instruction 1 is executed accordingly. The execution condition that was stored at the branching point is then re-loaded (a LOAD instruction with TR 0 as the operand), this is ANDed with the status of IR 00002, and instruction 2 is executed accordingly.

The following example shows an application using two TR bits.

Address	Instruction	0	perands
00000	LD		00000
00001	OUT	TR	0
00002	AND		00001
00003	OUT	TR	1
00004	AND		00002
00005	Instruction 1		
00006	LD	TR	1
00007	AND		00003
00008	Instruction 2		
00009	LD	TR	0
00010	AND		00004
00011	Instruction 3		
00012	LD	TR	0
00013	AND NOT		00005
00014	Instruction 4		

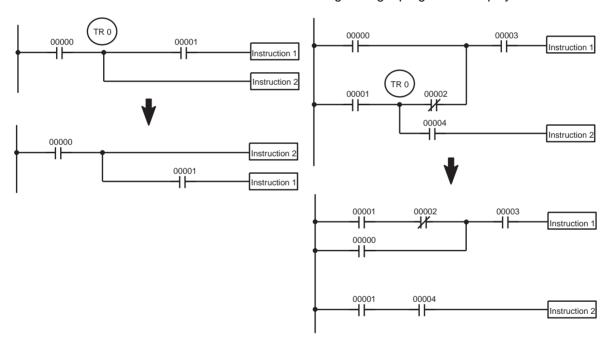

In this example, TR 0 and TR 1 are used to store the execution conditions at the branching points. After executing instruction 1, the execution condition stored in TR 1 is loaded for an AND with the status IR 00003. The execution condition stored in TR 0 is loaded twice, the first time for an AND with the sta-

tus of IR 00004 and the second time for an AND with the inverse of the status of IR 00005.

TR bits can be used as many times as required as long as the same TR bit is not used more than once in the same instruction block. Here, a new instruction block is begun each time execution returns to the bus bar. If, in a single instruction block, it is necessary to have more than eight branching points that require the execution condition be saved, interlocks (which are described next) must be used.

When drawing a ladder diagram, be careful not to use TR bits unless necessary. Often the number of instructions required for a program can be reduced and ease of understanding a program increased by redrawing a diagram that would otherwise required TR bits. In both of the following pairs of diagrams, the bottom versions require fewer instructions and do not require TR bits. In the first example, this is achieved by reorganizing the parts of the instruction block: the bottom one, by separating the second OUTPUT instruction and using another LOAD instruction to create the proper execution condition for it.

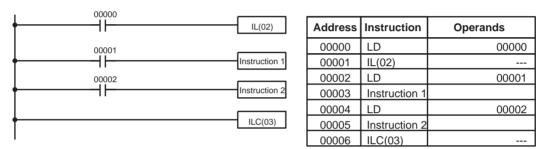

Note Although simplifying programs is always a concern, the order of execution of instructions is sometimes important. For example, a MOVE instruction may be required before the execution of a BINARY ADD instruction to place the proper data in the required operand word. Be sure that you have considered execution order before reorganizing a program to simplify it.

Note TR bits are must be input by the user only when programming using mnemonic code. They are not necessary when inputting ladder diagrams directly because they are processed for you automatically. The above limitations on the number of branching points requiring TR bits, and considerations on methods to reduce the number of programming instructions, still hold.

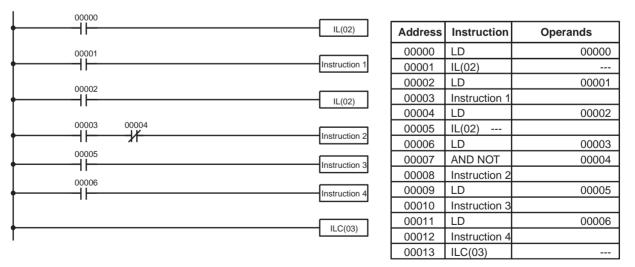

The problem of storing execution conditions at branching points can also be handled by using the INTERLOCK (IL(02)) and INTERLOCK CLEAR (ILC(03)) instructions to eliminate the branching point completely while allowing a specific execution condition to control a group of instructions. The INTERLOCK and INTERLOCK CLEAR instructions are always used together. When an INTERLOCK instruction is placed before a section of a ladder program, the execution condition for the INTERLOCK instruction will control the execution of all instruction up to the next INTERLOCK CLEAR instruction. If the execution condition for the INTERLOCK instruction is OFF, all right-hand instructions through the next INTERLOCK CLEAR instruction will be executed with OFF execution conditions to reset the entire section of the ladder diagram. The effect that this has on particular instructions is described in *5-11 INTERLOCK and INTERLOCK CLEAR – IL(02) and ILC(03)*.

Diagram B can also be corrected with an interlock. Here, the conditions leading up to the branching point are placed on an instruction line for the INTER-LOCK instruction, all of lines leading from the branching point are written as separate instruction lines, and another instruction line is added for the INTER-LOCK CLEAR instruction. No conditions are allowed on the instruction line for INTERLOCK CLEAR. Note that neither INTERLOCK nor INTERLOCK CLEAR requires an operand.

If IR 00000 is ON in the revised version of diagram B, above, the status of IR 00001 and that of IR 00002 would determine the execution conditions for instructions 1 and 2, respectively. Because IR 00000 is ON, this would produce the same results as ANDing the status of each of these bits. If IR 00000 is OFF, the INTERLOCK instruction would produce an OFF execution condition for instructions 1 and 2 and then execution would continue with the instruction line following the INTERLOCK CLEAR instruction.

As shown in the following diagram, more than one INTERLOCK instruction can be used within one instruction block; each is effective through the next INTERLOCK CLEAR instruction.

If IR 00000 in the above diagram is OFF (i.e., if the execution condition for the first INTERLOCK instruction is OFF), instructions 1 through 4 would be executed with OFF execution conditions and execution would move to the instruction following the INTERLOCK CLEAR instruction. If IR 00000 is ON, the

status of IR 00001 would be loaded as the execution condition for instruction 1 and then the status of IR 00002 would be loaded to form the execution condition for the second INTERLOCK instruction. If IR 00002 is OFF, instructions 2 through 4 will be executed with OFF execution conditions. If IR 00002 is ON, IR 00003, IR 00005, and IR 00006 will determine the first execution condition in new instruction lines.

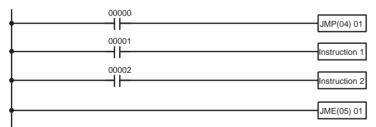

4-3-9 Jumps

A specific section of a program can be skipped according to a designated execution condition. Although this is similar to what happens when the execution condition for an INTERLOCK instruction is OFF, with jumps, the operands for all instructions maintain status. Jumps can therefore be used to control devices that require a sustained output, e.g., pneumatics and hydraulics, whereas interlocks can be used to control devices that do not required a sustained output, e.g., electronic instruments.

Jumps are created using the JUMP (JMP(04)) and JUMP END (JME(05)) instructions. If the execution condition for a JUMP instruction is ON, the program is executed normally as if the jump did not exist. If the execution condition for the JUMP instruction is OFF, program execution moves immediately to a JUMP END instruction without changing the status of anything between the JUMP and JUMP END instruction.

All JUMP and JUMP END instructions are assigned jump numbers ranging between 00 and 99. There are two types of jumps. The jump number used determines the type of jump.

A jump can be defined using jump numbers 01 through 99 only once, i.e., each of these numbers can be used once in a JUMP instruction and once in a JUMP END instruction. When a JUMP instruction assigned one of these numbers is executed, execution moves immediately to the JUMP END instruction that has the same number as if all of the instruction between them did not exist. Diagram B from the TR bit and interlock example could be redrawn as shown below using a jump. Although 01 has been used as the jump number, any number between 01 and 99 could be used as long as it has not already been used in a different part of the program. JUMP and JUMP END require no other operand and JUMP END never has conditions on the instruction line leading to it.

Address	Instruction	Operands
00000	LD	00000
00001	JMP(04)	01
00002	LD	00001
00003	Instruction 1	
00004	LD	00002
00005	Instruction 2	
00006	JME(05)	01

Diagram B: Corrected with a Jump

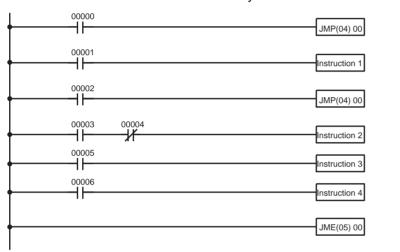

This version of diagram B would have a shorter execution time when IR 00000 was OFF than any of the other versions.

The other type of jump is created with a jump number of 00. As many jumps as desired can be created using jump number 00 and JUMP instructions using 00 can be used consecutively without a JUMP END using 00 between them. It is even possible for all JUMP 00 instructions to move program execution to the same JUMP END 00, i.e., only one JUMP END 00 instruction is required for all JUMP 00 instruction in the program. When 00 is used as the jump number for a JUMP instruction, program execution moves to the instruc-

Section 4-4

tion following the next JUMP END instruction with a jump number of 00. Although, as in all jumps, no status is changed and no instructions are executed between the JUMP 00 and JUMP END 00 instructions, the program must search for the next JUMP END 00 instruction, producing a slightly longer execution time.

Execution of programs containing multiple JUMP 00 instructions for one JUMP END 00 instruction is similar to that of interlocked sections. The following diagram is the same as that used for the interlock example above, except redrawn with jumps. The execution of this diagram would differ from that of the diagram described above (e.g., in the previous diagram interlocks would reset certain parts of the interlocked section, however, jumps do not affect the status of any bit between the JUMP and JUMP END instructions).

Address	Instruction	Operands
00000	LD	00000
00001	JMP(04)	00
00002	LD	00001
00003	Instruction 1	
00004	LD	00002
00005	JMP(04)	00
00006	LD	00003
00007	AND NOT	00004
00008	Instruction 2	
00009	LD	00005
00010	Instruction 3	
00011	LD	00006
00012	Instruction 4	
00013	JME(05)	00

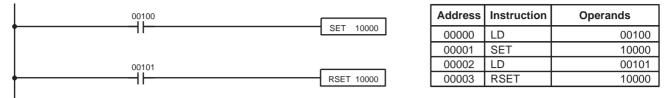

4-4 Controlling Bit Status

There are seven basic instructions that can be used generally to control individual bit status. These are the OUTPUT, OUTPUT NOT, SET, RESET, DIF-FERENTIATE UP, DIFFERENTIATE DOWN, and KEEP instructions. All of these instructions appear as the last instruction in an instruction line and take a bit address for an operand. Although details are provided in *5-8 Bit Control Instructions*, these instructions (except for OUTPUT and OUTPUT NOT, which have already been introduced) are described here because of their importance in most programs. Although these instructions are used to turn ON and OFF output bits in the IR area (i.e., to send or stop output signals to external devices), they are also used to control the status of other bits in the IR area or in other data areas.

4-4-1 SET and RESET

The SET and RESET instructions are very similar to the OUTPUT and OUT-PUT NOT instructions except that they only change the status of their operand bits for ON execution conditions. Neither instructions will affect the status of its operand bit when the execution condition is OFF.

SET will turn ON the operand bit when the execution condition goes ON, but unlike the OUTPUT instruction, SET will not turn OFF the operand bit when the execution condition goes OFF. RESET will turn OFF the operand bit when the execution condition goes OFF, but unlike OUTPUT NOT, RESET will not turn ON the operand bit when the execution condition goes OFF. In the following example, IR 10000 will be turned ON when IR 00100 goes ON and will remain ON until IR 00101 goes ON, regardless of the status of IR 00100. When IR 00101 goes ON, RESET will turn IR 10000 OFF.

4-4-2 DIFFERENTIATE UP and DIFFERENTIATE DOWN

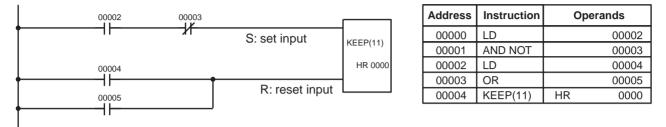

DIFFERENTIATE UP and DIFFERENTIATE DOWN instructions are used to turn the operand bit ON for one cycle at a time. The DIFFERENTIATE UP instruction turns ON the operand bit for one cycle after the execution condition for it goes from OFF to ON; the DIFFERENTIATE DOWN instruction turns ON the operand bit for one cycle after the execution condition for it goes from ON to OFF. Both of these instructions require only one line of mnemonic code.

		Address	Instruction	Operands
I	DIFU(13) 01000	00000	LD	00000
		00001	DIFU(13)	01000
	00001			
1	DIFD(14) 01001	Address	Instruction	Operands
I		00000	LD	00001
		00001	DIFD(14)	01001

Here, IR 01000 will be turned ON for one cycle after IR 00000 goes ON. The next time DIFU(13) 01000 is executed, IR 01000 will be turned OFF, regardless of the status of IR 00000. With the DIFFERENTIATE DOWN instruction, IR 01001 will be turned ON for one cycle after IR 00001 goes OFF (IR 01001 will be kept OFF until then), and will be turned OFF the next time DIFD(14) 01001 is executed.

4-4-3 KEEP

The KEEP instruction is used to maintain the status of the operand bit based on two execution conditions. To do this, the KEEP instruction is connected to two instruction lines. When the execution condition at the end of the first instruction line is ON, the operand bit of the KEEP instruction is turned ON. When the execution condition at the end of the second instruction line is ON, the operand bit of the KEEP instruction is turned OFF. The operand bit for the KEEP instruction will maintain its ON or OFF status even if it is located in an interlocked section of the diagram. In the following example, HR 0000 will be turned ON when IR 00002 is ON and IR 00003 is OFF. HR 0000 will then remain ON until either IR 00004 or IR 00005 turns ON. With KEEP, as with all instructions requiring more than one instruction line, the instruction lines are coded first before the instruction that they control.

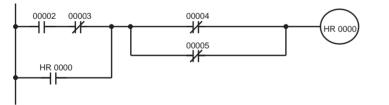

4-4-4 Self-maintaining Bits (Seal)

Although the KEEP instruction can be used to create self-maintaining bits, it is sometimes necessary to create self-maintaining bits in another way so that they can be turned OFF when in an interlocked section of a program.

To create a self-maintaining bit, the operand bit of an OUTPUT instruction is used as a condition for the same OUTPUT instruction in an OR setup so that the operand bit of the OUTPUT instruction will remain ON or OFF until changes occur in other bits. At least one other condition is used just before the OUTPUT instruction to function as a reset. Without this reset, there would be no way to control the operand bit of the OUTPUT instruction.

The above diagram for the KEEP instruction can be rewritten as shown below. The only difference in these diagrams would be their operation in an interlocked program section when the execution condition for the INTERLOCK instruction was ON. Here, just as in the same diagram using the KEEP instruction, two reset bits are used, i.e., HR 0000 can be turned OFF by turning ON either IR 00004 or IR 00005.

Address	Instruction	Operands
00000	LD	00002
00001	AND NOT	00003
00002	OR	HR 0000
00003	AND NOT	00004
00004	OR NOT	00005
00005	OUT	HR 0000

4-5 Work Bits (Internal Relays)

In programming, combining conditions to directly produce execution conditions is often extremely difficult. These difficulties are easily overcome, however, by using certain bits to trigger other instructions indirectly. Such programming is achieved by using work bits. Sometimes entire words are required for these purposes. These words are referred to as work words.

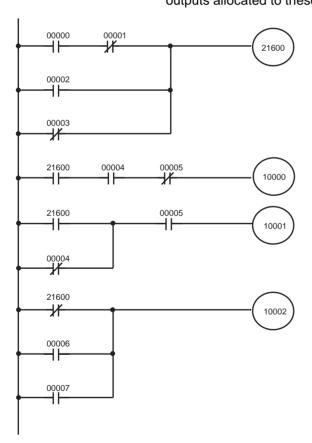

Work bits are not transferred to or from the PC. They are bits selected by the programmer to facilitate programming as described above. I/O bits and other dedicated bits cannot be used as works bits. All bits in the IR area that are not allocated as I/O bits, and certain unused bits in the AR area, are available for use as work bits. Be careful to keep an accurate record of how and where you use work bits. This helps in program planning and writing, and also aids in debugging operations.

Work Bit Applications Examples given later in this subsection show two of the most common ways to employ work bits. These should act as a guide to the almost limitless number of ways in which the work bits can be used. Whenever difficulties arise in programming a control action, consideration should be given to work bits and how they might be used to simplify programming.

Work bits are often used with the OUTPUT, OUTPUT NOT, DIFFERENTIATE UP, DIFFERENTIATE DOWN, and KEEP instructions. The work bit is used first as the operand for one of these instructions so that later it can be used as a condition that will determine how other instructions will be executed. Work bits can also be used with other instructions, e.g., with the SHIFT REGISTER instruction (SFT(10)). An example of the use of work words and bits with the SHIFT REGISTER instruction is provided in *5-16-1 SHIFT REGISTER* – *SFT(10)*.

Although they are not always specifically referred to as work bits, many of the bits used in the examples in *SECTION 5 Instruction Set* use work bits. Understanding the use of these bits is essential to effective programming.

Reducing Complex Conditions Work bits can be used to simplify programming when a certain combination of conditions is repeatedly used in combination with other conditions. In the following example, IR 00000, IR 00001, IR 00002, and IR 00003 are combined in a logic block that stores the resulting execution condition as the status of IR 21600. IR 21600 is then combined with various other conditions to determine output conditions for IR 10000, IR 10001, and IR 10002, i.e., to turn the outputs allocated to these bits ON or OFF.

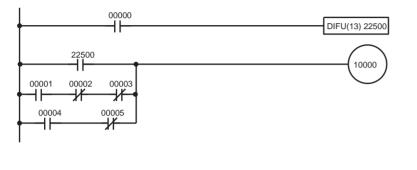

Address	Instruction	Operands
00000	LD	00000
00001	AND NOT	00001
00002	OR	00002
00003	OR NOT	00003
00004	OUT	21600
00005	LD	21600
00006	AND	00004
00007	AND NOT	00005
00008	OUT	10000
00009	LD	21600
00010	OR NOT	00004
00011	AND	00005
00012	OUT	10001
00013	LD NOT	21600
00014	OR	00006
00015	OR	00007
00016	OUT	10002

Differentiated Conditions

Work bits can also be used if differential treatment is necessary for some, but not all, of the conditions required for execution of an instruction. In this example, IR 10000 must be left ON continuously as long as IR 001001 is ON and both IR 00002 and IR 00003 are OFF, or as long as IR 00004 is ON and IR

00005 is OFF. It must be turned ON for only one cycle each time IR 00000 turns ON (unless one of the preceding conditions is keeping it ON continuously).

This action is easily programmed by using IR 22500 as a work bit as the operand of the DIFFERENTIATE UP instruction (DIFU(13)). When IR 00000 turns ON, IR 22500 will be turned ON for one cycle and then be turned OFF the next cycle by DIFU(13). Assuming the other conditions controlling IR 10000 are not keeping it ON, the work bit IR 22500 will turn IR 10000 ON for one cycle only.

Address	Instruction	Operands
00000	LD	00000
00001	DIFU(13)	22500
00002	LD	22500
00003	LD	00001
00004	AND NOT	00002
00005	AND NOT	00003
00006	OR LD	
00007	LD	00004
00008	AND NOT	00005
00009	OR LD	
00010	OUT	10000

4-6 Programming Precautions

The number of conditions that can be used in series or parallel is unlimited as long as the memory capacity of the PC is not exceeded. Therefore, use as many conditions as required to draw a clear diagram. Although very complicated diagrams can be drawn with instruction lines, there must not be any conditions on lines running vertically between two other instruction lines. Diagram A shown below, for example, is not possible, and should be drawn as diagram B. Mnemonic code is provided for diagram B only; coding diagram A would be impossible.

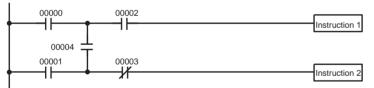

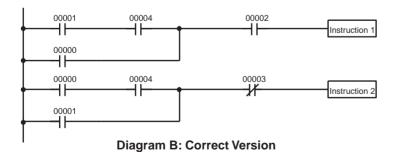

Diagram A: Not Programmable

Address	Instruction	Operands
00000	LD	00001
00001	AND	00004
00002	OR	00000
00003	AND	00002
00004	Instruction 1	
00005	LD	00000
00006	AND	00004
00007	OR	00001
00008	AND NOT	00003
00009	Instruction 2	

The number of times any particular bit can be assigned to conditions is not limited, so use them as many times as required to simplify your program.

Often, complicated programs are the result of attempts to reduce the number of times a bit is used.

Except for instructions for which conditions are not allowed (e.g., INTERLOCK CLEAR and JUMP END, see below), every instruction line must also have at least one condition on it to determine the execution condition for the instruction at the right. Again, diagram A , below, must be drawn as diagram B. If an instruction must be continuously executed (e.g., if an output must always be kept ON while the program is being executed), the Always ON Flag (SR 25313) in the SR area can be used.

Diagram A: Not Programmable for Most Instructions

There are a few exceptions to this rule, including the INTERLOCK CLEAR, JUMP END, and step instructions. Each of these instructions is used as the second of a pair of instructions and is controlled by the execution condition of the first of the pair. Conditions should not be placed on the instruction lines leading to these instructions. Refer to SECTION 5 Instruction Set for details.

When drawing ladder diagrams, it is important to keep in mind the number of instructions that will be required to input it. In diagram A, below, an OR LOAD instruction will be required to combine the top and bottom instruction lines. This can be avoided by redrawing as shown in diagram B so that no AND LOAD or OR LOAD instructions are required. Refer to *5-7-2 AND LOAD and OR LOAD* for more details.

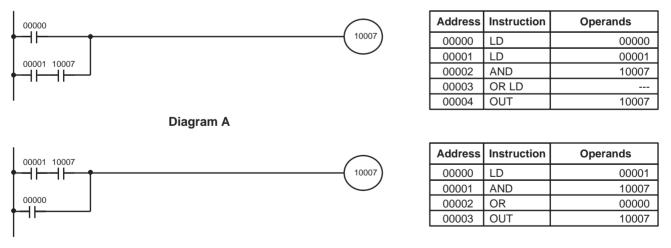

Diagram B

4-7 Program Execution

When program execution is started, the CPU Unit scans the program from top to bottom, checking all conditions and executing all instructions accordingly as it moves down the bus bar. It is important that instructions be placed in the proper order so that, for example, the desired data is moved to a word before that word is used as the operand for an instruction. Remember that an instruction line is completed to the terminal instruction at the right before executing an instruction lines branching from the first instruction line to other terminal instructions at the right.

Program execution is only one of the tasks carried out by the CPU Unit as part of the cycle time. Refer to *SECTION 7 PC Operations and Processing Time* for details.

SECTION 5 Instruction Set

The CQM1 and CPM1 have large programming instruction sets that allow for easy programming of complicated control processes. This section explains instructions individually and provides the ladder diagram symbol, data areas, and flags used with each.

The many instructions provided by these PCs are organized in the following subsections by instruction group. These groups include Ladder Diagram Instructions, instructions with fixed function codes, and set instructions.

Some instructions, such as Timer and Counter instructions, are used to control execution of other instructions, e.g., a TIM Completion Flag might be used to turn ON a bit when the time period set for the timer has expired. Although these other instructions are often used to control output bits through the Output instruction, they can be used to control execution of other instructions as well. The Output instructions used in examples in this manual can therefore generally be replaced by other instructions to modify the program for specific applications other than controlling output bits directly.

5-1 Notation

In the remainder of this manual, all instructions will be referred to by their mnemonics. For example, the OUTPUT instruction will be called OUT; the AND LOAD instruction, AND LD. If you're not sure of the instruction a mnemonic is used for, refer to *Appendix A Programming Instructions*.

If an instruction is assigned a function code, it will be given in parentheses after the mnemonic. These function codes, which are 2-digit decimal numbers, are used to input most instructions into the CPU Unit. A table of instructions listed in order of function codes is also provided in *Appendix A Programming Instructions*. Lists of instructions are also provided in *5-6 Instruction Tables*.

An @ before a mnemonic indicates the differentiated version of that instruction. Differentiated instructions are explained in *Section 5-4*.

5-2 Instruction Format

Most instructions have at least one or more operands associated with them. Operands indicate or provide the data on which an instruction is to be performed. These are sometimes input as the actual numeric values (i.e., as constants), but are usually the addresses of data area words or bits that contain the data to be used. A bit whose address is designated as an operand is called an operand bit; a word whose address is designated as an operand is called an operand word. In some instructions, the word address designated in an instruction indicates the first of multiple words containing the desired data.

Each instruction requires one or more words in Program Memory. The first word is the instruction word, which specifies the instruction and contains any definers (described below) or operand bits required by the instruction. Other operands required by the instruction are contained in following words, one operand per word. Some instructions require up to four words.

A definer is an operand associated with an instruction and contained in the same word as the instruction itself. These operands define the instruction rather than telling what data it is to use. Examples of definers are TC numbers, which are used in timer and counter instructions to create timers and counters, as well as jump numbers (which define which Jump instruction is paired with which Jump End instruction). Bit operands are also contained in the same word as the instruction itself, although these are not considered definers.

5-3 Data Areas, Definer Values, and Flags

In this section, each instruction description includes its ladder diagram symbol, the data areas that can be used by its operands, and the values that can be used as definers. Details for the data areas are also specified by the operand names and the type of data required for each operand (i.e., word or bit and, for words, hexadecimal or BCD).

Not all addresses in the specified data areas are necessarily allowed for an operand, e.g., if an operand requires two words, the last word in a data area cannot be designated as the first word of the operand because all words for a single operand must be within the same data area. Other specific limitations are given in a *Limitations* subsection. Refer to *SECTION 3 Memory Areas* for addressing conventions and the addresses of flags and control bits.

▲ Caution The IR and SR areas are considered as separate data areas. If an operand has access to one area, it doesn't necessarily mean that the same operand will have access to the other area. The border between the IR and SR areas can, however, be crossed for a single operand, i.e., the last bit in the IR area may be specified for an operand that requires more than one word as long as the SR area is also allowed for that operand.

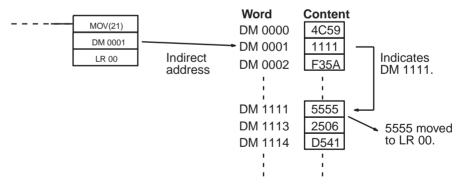

The *Flags* subsection lists flags that are affected by execution of an instruction. These flags include the following SR area flags.

Abbreviation	Name	Bit
ER	Instruction Execution Error Flag	25503
CY	Carry Flag	25504
GR	Greater Than Flag	25505
EQ	Equals Flag	25506
LE	Less Than Flag	25507

ER is the flag most commonly used for monitoring an instruction's execution. When ER goes ON, it indicates that an error has occurred in attempting to execute the current instruction. The *Flags* subsection of each instruction lists possible reasons for ER being ON. ER will turn ON if operands are not entered correctly. Instructions are not executed when ER is ON. A table of instructions and the flags they affect is provided in *Appendix B Error and Arithmetic Flag Operation*.

Indirect Addressing When the DM area is specified for an operand, an indirect address can be used. Indirect DM addressing is specified by placing an asterisk before the DM: *DM.

When an indirect DM address is specified, the designated DM word will contain the address of the DM word that contains the data that will be used as the operand of the instruction. If, for example, *DM 0001 was designated as the first operand and LR 00 as the second operand of MOV(21), the contents of DM 0001 was 1111, and DM 1111 contained 5555, the value 5555 would be moved to LR 00.

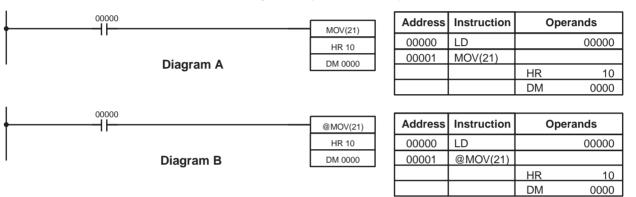

When using indirect addressing, the address of the desired word must be in BCD and it must specify a word within the DM area. In the above example, the content of *DM 0000 would have to be in BCD between 0000 and 1999.

Designating Constants Although data area addresses are most often given as operands, many operands and all definers are input as constants. The available value range for a given definer or operand depends on the particular instruction that uses it. Constants must also be entered in the form required by the instruction, i.e., in BCD or in hexadecimal.

5-4 Differentiated Instructions

Most instructions are provided in both differentiated and non-differentiated forms. Differentiated instructions are distinguished by an @ in front of the instruction mnemonic.

A non-differentiated instruction is executed each time it is scanned as long as its execution condition is ON. A differentiated instruction is executed only once after its execution condition goes from OFF to ON. If the execution condition has not changed or has changed from ON to OFF since the last time the instruction was scanned, the instruction will not be executed. The following two examples show how this works with MOV(21) and @MOV(21), which are used to move the data in the address designated by the first operand to the address designated by the second operand.

In diagram A, the non-differentiated MOV(21) will move the content of HR 10 to DM 0000 whenever it is scanned with 00000. If the cycle time is 80 ms and 00000 remains ON for 2.0 seconds, this move operation will be performed 25 times and only the last value moved to DM 0000 will be preserved there.

In diagram B, the differentiated @MOV(21) will move the content of HR 10 to DM 0000 only once after 00000 goes ON. Even if 00000 remains ON for 2.0 seconds with the same 80 ms cycle time, the move operation will be executed only once during the first cycle in which 00000 has changed from OFF to ON. Because the content of HR 10 could very well change during the 2 seconds while 00000 is ON, the final content of DM 0000 after the 2 seconds could be different depending on whether MOV(21) or @MOV(21) was used.

All operands, ladder diagram symbols, and other specifications for instructions are the same regardless of whether the differentiated or non-differentiated form of an instruction is used. When inputting, the same function codes are also used, but NOT is input after the function code to designate the differentiated form of an instruction. Most, but not all, instructions have differentiated forms.

Refer to 5-11 INTERLOCK and INTERLOCK CLEAR – IL(02) and ILC(03) for the effects of interlocks on differentiated instructions.

The CQM1 also provides differentiation instructions: DIFU(13) and DIFD(14). DIFU(13) operates the same as a differentiated instruction, but is used to turn ON a bit for one cycle. DIFD(14) also turns ON a bit for one cycle, but does it when the execution condition has changed from ON to OFF. Refer to 5-8-4 DIFFERENTIATE UP and DOWN – DIFU(13) and DIFD(14) for details.

5-5 Coding Right-hand Instructions

Writing mnemonic code for ladder instructions is described in *SECTION 4 Ladder-diagram Programming*. Converting the information in the ladder diagram symbol for all other instructions follows the same pattern, as described below, and is not specified for each instruction individually.

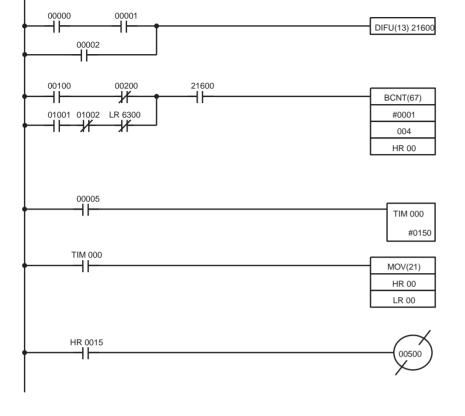

The first word of any instruction defines the instruction and provides any definers. If the instruction requires only a signal bit operand with no definer, the bit operand is also placed on the same line as the mnemonic. All other operands are placed on lines after the instruction line, one operand per line and in the same order as they appear in the ladder symbol for the instruction.

The address and instruction columns of the mnemonic code table are filled in for the instruction word only. For all other lines, the left two columns are left blank. If the instruction requires no definer or bit operand, the data column is left blank for first line. It is a good idea to cross through any blank data column spaces (for all instruction words that do not require data) so that the data column can be quickly scanned to see if any addresses have been left out.

If an IR or SR address is used in the data column, the left side of the column is left blank. If any other data area is used, the data area abbreviation is placed on the left side and the address is placed on the right side. If a constant to be input, the number symbol (#) is placed on the left side of the data column and the number to be input is placed on the right side. Any numbers input as definers in the instruction word do not require the number symbol on the right side. TC bits, once defined as a timer or counter, take a TIM (timer) or CNT (counter) prefix.

When coding an instruction that has a function code, be sure to write in the function code, which will be necessary when inputting the instruction via the Programming Console. Also be sure to designate the differentiated instruction with the @ symbol.

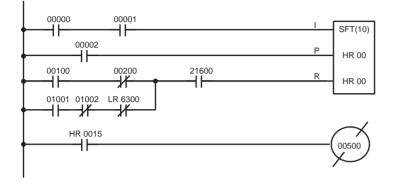

Note The mnemonics of expansion instructions are followed by "(—)" as the function code to indicate that they must be assigned function codes by the user in the instructions table before they can be used in programming. Refer to page 118 for details. The following diagram and corresponding mnemonic code illustrates the points described above.

Address	Instruction	Dat	a		
00000	LD		00000		
00001	AND		00001		
00002	OR	1 00002			
00003	DIFU(13)		2 1600		
00004	LD		00100		
00005	AND NOT		00200		
00006	LD		01001		
00007	AND NOT		ı 01002		
00008	AND NOT	LR	6 300		
00009	OR LD		· _		
00010	AND		21600		
00011	BCNT(67)		. —		
		#	ı 0001		
			0 04		
		HR	00		
00012	LD		00005		
00013	TIM		000		
		#	ı 0150		
00014	LD	TIM	000 I		
00015	MOV(21)		<u> </u>		
		HR	00		
		LR	00		
00016	LD	HR	ı 0015		
00017	OUT NOT	۱ 00500			

Multiple Instruction Lines

If a right-hand instruction requires multiple instruction lines (such as KEEP(11)), all of the lines for the instruction are entered before the right-hand instruction. Each of the lines for the instruction is coded, starting with LD or LD NOT, to form `logic blocks' that are combined by the right-hand instruction. An example of this for SFT(10) is shown below.

Address	Instruction	Data			
00000	LD	00000			
00001	AND	00001			
00002	LD	ı 00002			
00003	LD	¹ 00100			
00004	AND NOT	00200			
00005	LD	01001			
00006	AND NOT	01002			
00007	AND NOT	LR I 6300			
00008	OR LD	· ·			
00009	AND	21600			
00010	SFT(10)	HR 00			
		HR 1 00			
00011	LD	HR I 0015			
00012	OUT NOT	¹ 00500			

5-6 Instruction Tables

This section provides tables of the instructions available in the CQM1. The first few tables can be used to find instructions by function code. The last table can be used to find instructions by mnemonic. In both tables, the @ symbol indicates instructions with differentiated forms.

5-6-1 CQM1 Function Codes

The following table lists the CQM1 instructions that have fixed function codes. Each instruction is listed by mnemonic and by instruction name. Use the numbers in the leftmost column as the left digit and the number in the column heading as the right digit of the function code.

Left	Right digit									
digit	0	1	2	3	4	5	6	7	8	9

5-7 Ladder Diagram Instructions

Ladder diagram instructions include ladder instructions and logic block instructions and correspond to the conditions on the ladder diagram. Logic block instructions are used to relate more complex parts.

5-7-1 LOAD, LOAD NOT, AND, AND NOT, OR, and OR NOT

	Ladder Symbols	Operand Data Areas
	В	B: Bit
LOAD – LD	▶ 1 ⊢	IR, SR, AR, HR, TC, LR, TR
	I	
LOAD NOT – LD NOT	B	B: Bit
		IR, SR, AR, HR, TC, LR
AND – AND	B	B: Bit
		IR, SR, AR, HR, TC, LR
AND NOT – AND NOT	B	B: Bit
AND NOT - AND NOT		IR, SR, AR, HR, TC, LR
OR – OR		B: Bit
	B	IR, SR, AR, HR, TC, LR
OR NOT – OR NOT		B: Bit
	B	IR, SR, AR, HR, TC, LR
	A 1	
Limitations	There is no limit to the number of any c	

There is no limit to the number of any of these instructions, or restrictions in the order in which they must be used, as long as the memory capacity of the PC is not exceeded.

Description These six basic instructions correspond to the conditions on a ladder diagram. As described in *SECTION 4 Ladder-diagram Programming*, the status of the bits assigned to each instruction determines the execution conditions for all other instructions. Each of these instructions and each bit address can be used as many times as required. Each can be used in as many of these instructions as required.

The status of the bit operand (B) assigned to LD or LD NOT determines the first execution condition. AND takes the logical AND between the execution condition and the status of its bit operand; AND NOT, the logical AND between the execution condition and the inverse of the status of its bit operand. OR takes the logical OR between the execution condition and the status of its bit operand; OR NOT, the logical OR between the execution condition and the status of its bit operand; OR NOT, the logical OR between the execution condition and the status of its bit operand.

Flags

There are no flags affected by these instructions.

5-7-2 AND LOAD and OR LOAD

AND LOAD – AND LD

Ladder Symbol

OR LOAD - OR LD

Ladder Symbol

			-
	 	-	
00002	00003		
		<u> </u>	

00002

00003

00000

00001 I

Description When instructions are combined into blocks that cannot be logically combined using only OR and AND operations, AND LD and OR LD are used. Whereas AND and OR operations logically combine a bit status and an execution condition, AND LD and OR LD logically combine two execution conditions, the current one and the last unused one.

In order to draw ladder diagrams, it is not necessary to use AND LD and OR LD instructions, nor are they necessary when inputting ladder diagrams directly, as is possible from the SSS. They are required, however, to convert the program to and input it in mnemonic form.

In order to reduce the number of programming instructions required, a basic understanding of logic block instructions is required. For an introduction to logic blocks, refer to *4-3-6 Logic Block Instructions*.

Flags

There are no flags affected by these instructions.

5-8 Bit Control Instructions

There are seven instructions that can be used generally to control individual bit status. These are OUT, OUT NOT, DIFU(13), DIFD(14), SET, RSET, and KEEP(11). These instructions are used to turn bits ON and OFF in different ways.

5-8-1 OUTPUT and OUTPUT NOT – OUT and OUT NOT

OUTPUT – OUT

Ladder Symbol

OUTPUT NOT – OUT NOT

Ladder Symbol

Operand Data Areas

Operand Data Areas

Limitations

Any output bit can generally be used in only one instruction that controls its status.

Description

OUT and OUT NOT are used to control the status of the designated bit according to the execution condition.

OUT turns ON the designated bit for an ON execution condition, and turns OFF the designated bit for an OFF execution condition. With a TR bit, OUT appears at a branching point rather than at the end of an instruction line. Refer to *4-3-8 Branching Instruction Lines* for details.

OUT NOT turns ON the designated bit for a OFF execution condition, and turns OFF the designated bit for an ON execution condition.

OUT and OUT NOT can be used to control execution by turning ON and OFF bits that are assigned to conditions on the ladder diagram, thus determining execution conditions for other instructions. This is particularly helpful and allows a complex set of conditions to be used to control the status of a single work bit, and then that work bit can be used to control other instructions.

The length of time that a bit is ON or OFF can be controlled by combining the OUT or OUT NOT with TIM. Refer to Examples under *5-15-1 TIMER – TIM* for details.

Flags

There are no flags affected by these instructions.

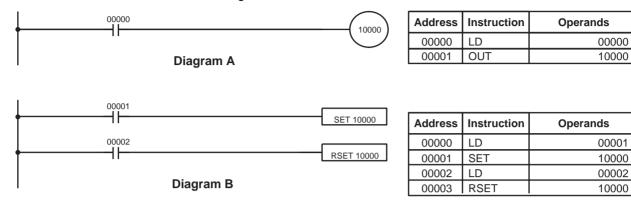

5-8-2 SET and RESET – SET and RSET

	Ladder Symbols	Operand Data Areas
	SET B	B : Bit IR, SR, AR, HR, LR
	RSET B	B: Bit
		IR, SR, AR, HR, LR
Description	SET turns the operand bit ON when the ex not affect the status of the operand bit wh RSET turns the operand bit OFF when th does not affect the status of the operand bit OFF.	en the execution condition is OFF. ne execution condition is ON, and

Flags	There are no flags affected by these instruct	ctions.
Examples	The following examples demonstrate the or RSET. In the first example (Diagram A), IF whenever IR 00000 goes ON or OFF.	

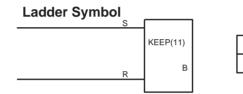

Bit Control Instructions

Section 5-8

In the second example (Diagram B), IR 10000 will be turned ON when IR 00001 goes ON and will remain ON (even if IR 00001 goes OFF) until IR 00002 goes ON.

5-8-3 KEEP – KEEP(11)

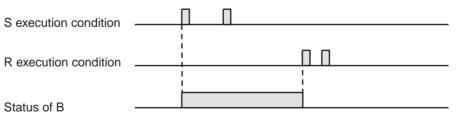

Operand Data Areas

B: Bit	
IR, SR, AR, HR, LR	

Limitations Any output bit can generally be used in only one instruction that controls its status.

KEEP(11) is used to maintain the status of the designated bit based on two execution conditions. These execution conditions are labeled S and R. S is the set input; R, the reset input. KEEP(11) operates like a latching relay that is set by S and reset by R.

When S turns ON, the designated bit will go ON and stay ON until reset, regardless of whether S stays ON or goes OFF. When R turns ON, the designated bit will go OFF and stay OFF until reset, regardless of whether R stays ON or goes OFF. The relationship between execution conditions and KEEP(11) bit status is shown below.

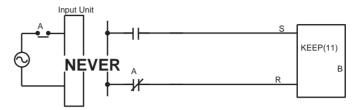

Flags

Description

There are no flags affected by this instruction.

Precautions

Exercise caution when using a KEEP reset line that is controlled by an external normally closed device. Never use an input bit in an inverse condition on the reset (R) for KEEP(11) when the input device uses an AC power supply. The delay in shutting down the PC's DC power supply (relative to the AC power supply to the input device) can cause the designated bit of KEEP(11) to be reset. This situation is shown below.

Bits used in KEEP are not reset in interlocks. Refer to the 5-11 INTERLOCK and INTERLOCK CLEAR – IL(02) and ILC(03) for details.

5-8-4 DIFFERENTIATE UP and DOWN – DIFU(13) and DIFD(14)

	Ladder Symbols	Operand Data Areas
	DIFU(13) B	B: Bit
		IR, SR, AR, HR, LR
	DIFD(14) B	B : Bit IR, SR, AR, HR, LR
Limitations	Any output bit can generally be used in o status.	nly one instruction that controls its

Examples of these are shown b	ngle-cycle execution of a particular sed with non-differentiated forms of s when their use will simplify pro-
Flags	There are no flags affected by these instru-	ctions.

Precautions

DIFU(13) and DIFD(14) operation can be uncertain when the instructions are programmed between IL and ILC, between JMP and JME, or in subroutines. Refer to 5-11 INTERLOCK and INTERLOCK CLEAR – IL(02) and ILC(03), 5-12 JUMP and JUMP END – JMP(04) and JME(05), 5-25 Subroutine Instructions, and 5-26-8 INTERRUPT CONTROL – INT(89).

Section 5-9

Example

In this example, IR 10014 will be turned ON for one cycle when IR 00000 goes from OFF to ON. IR 10015 will be turned ON for one cycle when IR 00000 goes from ON to OFF.

00000	DIFU(13) 10014	Address	Instruction	Operands
		00000	LD	00000
		00001	DIFU(13)	10014
	DIFD(14) 10015	00002	DIFD(14)	10015

There are no flags affected by NOP(00).

5-9 NO OPERATION – NOP(00)

Description

NOP(00) is not generally required in programming and there is no ladder symbol for it. When NOP(00) is found in a program, nothing is executed and the program execution moves to the next instruction. When memory is cleared prior to programming, NOP(00) is written at all addresses. NOP(00) can be input through the 00 function code.

Flags

5-10 END - END(01)

	Ladder Symbol ———	END(01)
Description	END(01) is required as the last instruction in tines, END(01) is placed after the last subro END(01) will be executed. END(01) can be to execute all instructions up to that point, a program, but it must be removed to execute t	utine. No instruction written after placed anywhere in the program s is sometimes done to debug a the remainder of the program.
	If there is no END(01) in the program, no inst error message "NO END INST" will appear.	tructions will be executed and the
Flags	END(01) turns OFF the ER, CY, GR, EQ, and	d LE flags.
5-11 INTERLOCK	and INTERLOCK CLEAR –	IL(02) and ILC(03)
	l adder Symbol	11 (02)

	-	IL(02)	
	Ladder Symbol ———	ILC(03)	
Description	IL(02) is always used in conjunction with IL locks are used to enable branching in the sa TR bits, but treatment of instructions betwee that with TR bits when the execution condition tion condition of IL(02) is ON, the program w ON execution condition used to start each where IL(02) is located through the next IL	time way as can be achi en IL(02) and ILC(03) di on for IL(02) is OFF. If the ill be executed as writted in instruction line from	ieved with iffers from the execu- en, with an the point

Instruction Lines for basic descriptions of both methods.

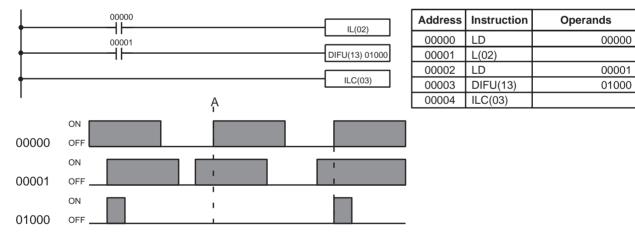

205

Instruction	Treatment
OUT and OUT NOT	Designated bit turned OFF.
TIM and TIMH(15)	Reset.
CNT, CNTR(12)	PV maintained.
KEEP(11)	Bit status maintained.
DIFU(13) and DIFD(14)	Not executed (see below).
All other instructions	The instructions are not executed, and all IR, AR, LR, HR, and SR bits and words written to as operands in the instructions are turned OFF.

If the execution condition for IL(02) is OFF, the interlocked section between IL(02) and ILC(03) will be treated as shown in the following table:

IL(02) and ILC(03) do not necessarily have to be used in pairs. IL(02) can be used several times in a row, with each IL(02) creating an interlocked section through the next ILC(03). ILC(03) cannot be used unless there is at least one IL(02) between it and any previous ILC(03).

DIFU(13) and DIFD(14) in Interlocks Changes in the execution condition for a DIFU(13) or DIFD(14) are not recorded if the DIFU(13) or DIFD(14) is in an interlocked section and the execution condition for the IL(02) is OFF. When DIFU(13) or DIFD(14) is execution in an interlocked section immediately after the execution condition for the IL(02) has gone ON, the execution condition for the DIFU(13) or DIFD(14) will be compared to the execution condition that existed before the interlock became effective (i.e., before the interlock condition for IL(02) went OFF). The ladder diagram and bit status changes for this are shown below. The interlock is in effect while 00000 is OFF. Notice that 01000 is not turned ON at the point labeled A even though 00001 has turned OFF and then back ON.

Precautions

There must be an ILC(03) following any one or more IL(02).

Although as many IL(02) instructions as are necessary can be used with one ILC(03), ILC(03) instructions cannot be used consecutively without at least one IL(02) in between, i.e., nesting is not possible. Whenever a ILC(03) is executed, all interlocks between the active ILC(03) and the preceding ILC(03) are cleared.

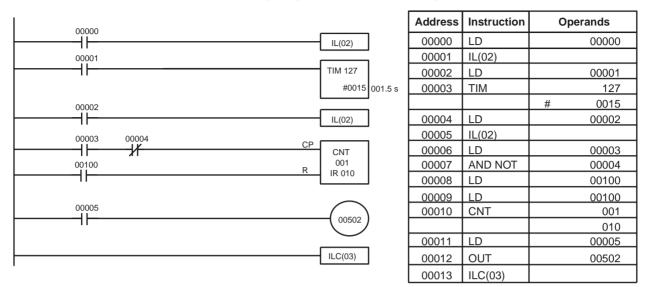

When more than one IL(02) is used with a single ILC(03), an error message will appear when the program check is performed, but execution will proceed normally.

Flags

There are no flags affected by these instructions.

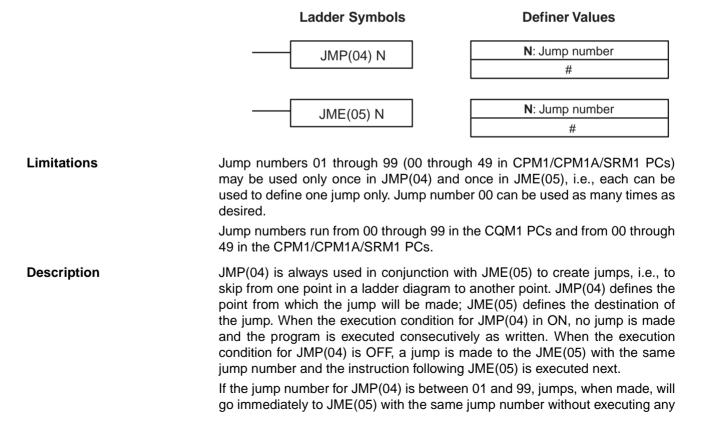

Example

The following diagram shows IL(02) being used twice with one ILC(03).

When the execution condition for the first IL(02) is OFF, TIM 127 will be reset to 1.5 s, CNT 001 will not be changed, and 00502 will be turned OFF. When the execution condition for the first IL(02) is ON and the execution condition for the second IL(02) is OFF, TIM 127 will be executed according to the status of 00001, CNT 001 will not be changed, and 00502 will be turned OFF. When the execution conditions for both the IL(02) are ON, the program will execute as written.

5-12 JUMP and JUMP END – JMP(04) and JME(05)

instructions in between. The status of timers, counters, bits used in OUT, bits used in OUT NOT, and all other status bits controlled by the instructions between JMP(04) and JMP(05) will not be changed. Each of these jump numbers can be used to define only one jump. Because all of instructions between JMP(04) and JME(05) are skipped, jump numbers 01 through 99 (01 through 49 in CPM1/CPM1A/SRM1 PCs) can be used to reduce cycle time.

Jump Number 00

If the jump number for JMP(04) is 00, the CPU Unit will look for the next JME(05) with a jump number of 00. To do so, it must search through the program, causing a longer cycle time (when the execution condition is OFF) than for other jumps.

The status of timers, counters, bits used in OUT, bits used in OUT NOT, and all other status controlled by the instructions between JMP(04) 00 and JMP(05) 00 will not be changed. jump number 00 can be used as many times as desired. A jump from JMP(04) 00 will always go to the next JME(05) 00 in the program. It is thus possible to use JMP(04) 00 consecutively and match them all with the same JME(05) 00. It makes no sense, however, to use JME(05) 00 consecutively, because all jumps made to them will end at the first JME(05) 00.

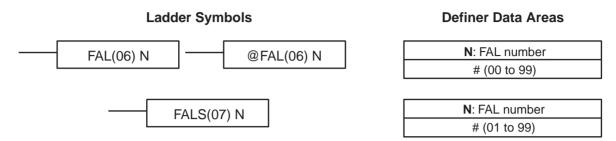

DIFU(13) and DIFD(14) in Jumps	Although DIFU(13) and DIFD(14) are designed to turn ON the designated bit for one cycle, they will not necessarily do so when written between JMP(04) and JMP (05). Once either DIFU(13) or DIFD(14) has turned ON a bit, it will remain ON until the next time DIFU(13) or DIFD(14) is executed again. In nor- mal programming, this means the next cycle. In a jump, this means the next time the jump from JMP(04) to JME(05) is not made, i.e., if a bit is turned ON by DIFU(13) or DIFD(14) and then a jump is made in the next cycle so that DIFU(13) or DIFD(14) are skipped, the designated bit will remain ON until the next time the execution condition for the JMP(04) controlling the jump is ON.
Precautions	When JMP(04) and JME(05) are not used in pairs, an error message will appear when the program check is performed. This message also appears if

appear when the program check is performed. This message also appears if JMP(04) 00 and JME(05) 00 are not used in pairs, but the program will execute properly as written.

 Flags
 There are no flags affected by these instructions.

Examples Examples of jump programs are provided in *4-3-9 Jumps*.

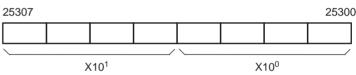

5-13 User Error Instructions: FAILURE ALARM AND RESET – FAL(06) and SEVERE FAILURE ALARM – FALS(07)

Description

FAL(06) and FALS(07) are provided so that the programmer can output error numbers for use in operation, maintenance, and debugging. When executed with an ON execution condition, either of these instructions will output a FAL number to bits 00 to 07 of SR 253. The FAL number that is output can be between 01 and 99 and is input as the definer for FAL(06) or FALS(07). FAL(06) with a definer of 00 is used to reset this area (see below).

FAL Area

FAL(06) produces a non-fatal error and FALS(07) produces a fatal error. When FAL(06) is executed with an ON execution condition, the ALARM/ ERROR indicator on the front of the CPU Unit will flash, but PC operation will continue. When FALS(07) is executed with an ON execution condition, the ALARM/ERROR indicator will light and PC operation will stop.

The system also generates error codes to the FAL area.

Resetting Errors

FAL error codes will be retained in memory, although only one of these is available in the FAL area. To access the other FAL codes, reset the FAL area by executing FAL(06) 00. Each time FAL(06) 00 is executed, another FAL error will be moved to the FAL area, clearing the one that is already there. FAL error codes are recorded in numerical order.

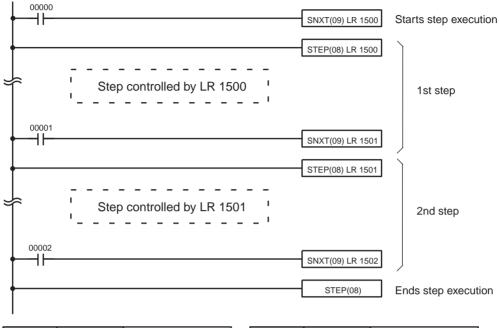

FAL(06) 00 is also used to clear message programmed with the instruction, MSG(46).

If the FAL area cannot be cleared, as is generally the case when FALS(07) is executed, first remove the cause of the error and then clear the FAL area through the Programming Console or SSS.

5-14 Step Instructions: STEP DEFINE and STEP START–STEP(08)/SNXT(09)

	Ladder Symbols	Definer Data Areas
——-[STEP(08) B STEP(08)	B: Control bit
L		IR, AR, HR, LR
	SNXT(09) B	B: Control bit IR, AR, HR, LR
Limitations	All control bits must be in the same wo	rd and must be consecutive.
Description	The step instructions STEP(08) and S breakpoints between sections in a larg executed as units and reset upon com ally be defined to correspond to an actu the application examples later in this se ming code, except that certain instru- JMP(04)/JME(05), and SBN(92)) may r STEP(08) uses a control bit in the IR or section of the program called a step. S condition, i.e., its execution is controlle cution of the step, SNXT(09) is used STEP(08). If SNXT(09) is executed wit with the same control bit is executed. step is not executed. The SNXT(09) in gram so that it is executed before the pr be used at different locations before th two different execution conditions (see o gram that has not been started with SN Once SNXT(09) is used in the progra STEP(08) is executed without a contr must be preceded by SNXT(09) with a bit may be any unused IR or HR bit. STEP(08).	the program so that the sections can be pletion. A section of program will usu- ual process in the application. (Refer to ection.) A step is like a normal program- lactions (i.e., END(01), IL(02)/ILC(03), not be included. If HR areas to define the beginning of a TEP(08) does not require an execution at through the control bit. To start exe- with the same control bit as used for th an ON execution condition, the step of the execution condition is OFF, the netruction must be written into the pro- rogram reaches the step it starts. It can e step to control the step according to example 2, below). Any step in the pro- IXT(09) will not be executed. am, step execution will continue until fol bit. STEP(08) without a control bit dummy control bit. The dummy control

Execution of a step is completed either by execution of the next SNXT(09) or by turning OFF the control bit for the step (see example 3 below). When the step is completed, all of the IR and HR bits in the step are turned OFF and all timers in the step are reset to their SVs. Counters, shift registers, and bits used in KEEP(11) maintain status. Two simple steps are shown below.

	Address	Instruction	Ор	erands		Address	Instruction	0	perands
	00000	LD		00000		00102	STEP(08)	LR	1501
	00001	SNXT(09)	LR	1500					
	00002	STEP(08)	LR	1500	=	ĉ	Step controlle	ed by LR	1501.
Ξ		Step controlle	ed by LR	1500. 😆	ĥ	00200	LD		00002
						00201	SNXT(09)	LR	1502
	00100	LD		00001		00202	STEP(08)		
	00101	SNXT(09)	LR	1501					

Steps can be programmed in consecutively. Each step must start with STEP(08) and generally ends with SNXT(09) (see example 3, below, for an exception). When steps are programmed in series, three types of execution are possible: sequential, branching, or parallel. The execution conditions for, and the positioning of, SNXT(09) determine how the steps are executed. The three examples given below demonstrate these three types of step execution.

Precautions

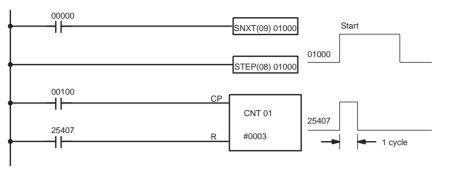

Interlocks, jumps, SBN(92), and END(01) cannot be used within step programs.

Bits used as control bits must not be used anywhere else in the program unless they are being used to control the operation of the step (see example 3, below). All control bits must be in the same word and must be consecutive.

If IR or LR bits are used for control bits, their status will be lost during any power interruption. If it is necessary to maintain status to resume execution at the same step, HR bits must be used.

Flags

25407: Step Start Flag; turns ON for one cycle when STEP(08) is executed and can be used to reset counters in steps as shown below if necessary.

Address	Instruction	Operands
00000	LD	00000
00001	SNXT(09)	01000

5-15 Timer and Counter Instructions

TIM and TIMH(15) are decrementing ON-delay timer instructions which require a TC number and a set value (SV). STIM(69) is used to control the interval timers, which are used to activate interrupt routines.

CNT is a decrementing counter instruction and CNTR(12) is a reversible counter instruction. Both require a TC number and a SV. Both are also connected to multiple instruction lines which serve as an input signal(s) and a reset. CTBL(63), INT(89), and PRV(62) are used to manage the high-speed counter. INT(89) is also used to stop pulse output.

Any one TC number cannot be defined twice, i.e., once it has been used as the definer in any of the timer or counter instructions, it cannot be used again. Once defined, TC numbers can be used as many times as required as operands in instructions other than timer and counter instructions.

TC numbers run from 000 through 511 in the CQM1 PCs and from 000 through 127 in the CPM1/CPM1A/SRM1 PCs. No prefix is required when using a TC number as a definer in a timer or counter instruction. Once defined as a timer, a TC number can be prefixed with TIM for use as an operand in certain instructions. The TIM prefix is used regardless of the timer instruction that was used to define the timer. Once defined as a counter, a TC number can be prefixed with CNT for use as an operand in certain instructions. The CNT is also used regardless of the counter instruction that was used to define the counter.

TC numbers can be designated as operands that require either bit or word data. When designated as an operand that requires bit data, the TC number accesses a bit that functions as a `Completion Flag' that indicates when the time/count has expired, i.e., the bit, which is normally OFF, will turn ON when the designated SV has expired. When designated as an operand that requires word data, the TC number accesses a memory location that holds the present value (PV) of the timer or counter. The PV of a timer or counter can thus be used as an operand in CMP(20), or any other instruction for which the TC area is allowed. This is done by designating the TC number used to define that timer or counter to access the memory location that holds the PV.

Section 5-15

Note that "TIM 000" is used to designate the TIMER instruction defined with TC number 000, to designate the Completion Flag for this timer, and to designate the PV of this timer. The meaning of the term in context should be clear, i.e., the first is always an instruction, the second is always a bit operand, and the third is always a word operand. The same is true of all other TC numbers prefixed with TIM or CNT.

An SV can be input as a constant or as a word address in a data area. If an IR area word assigned to an Input Unit is designated as the word address, the Input Unit can be wired so that the SV can be set externally through thumb-wheel switches or similar devices. Timers and counters wired in this way can only be set externally during RUN or MONITOR mode. All SVs, including those set externally, must be in BCD.

5-15-1 TIMER – TIM

		Definer Values		
	Ladder Symbol	N: TC number

details.

Flags

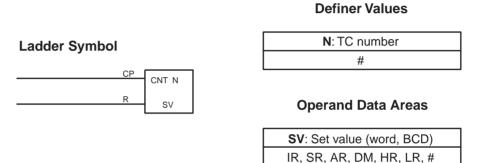

ER: SV is not in BCD.

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

- **Note** The timer set value must be BCD between #0000 and #9999. Operation will be as follows if #0000 or #0001 is set.
 - If #0000 is set, the Completion Flag will turn ON as soon as the timer's execution condition turns ON.
 - If #0001 is set, the Completion Flag may turn ON as soon as the timer's execution condition turns ON because timer accuracy is 0 to -0.1 s.

Consider the timer accuracy (0 to -0.1 s) when determining the proper set value.

5-15-2 COUNTER – CNT

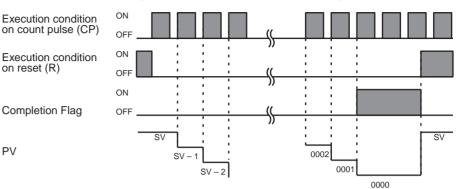

Limitations

Each TC number can be used as the definer in only one TIMER or COUNTER instruction. TC numbers run from 000 through 511 in the CQM1 PCs and from 000 through 127 in the CPM1/CPM1A/SRM1 PCs.

Description CNT is used to count down from SV when the execution condition on the count pulse, CP, goes from OFF to ON, i.e., the present value (PV) will be decremented by one whenever CNT is executed with an ON execution condition for CP and the execution condition was OFF for the last execution. If the execution condition has not changed or has changed from ON to OFF, the PV of CNT will not be changed. The Completion Flag for a counter is turned ON when the PV reaches zero and will remain ON until the counter is reset.

CNT is reset with a reset input, R. When R goes from OFF to ON, the PV is reset to SV. The PV will not be decremented while R is ON. Counting down from SV will begin again when R goes OFF. The PV for CNT will not be reset in interlocked program sections or by power interruptions.

Changes in execution conditions, the Completion Flag, and the PV are illustrated below. PV line height is meant only to indicate changes in the PV.

Program execution will continue even if a non-BCD SV is used, but the SV will not be correct.

SV is not in BCD.

ER:

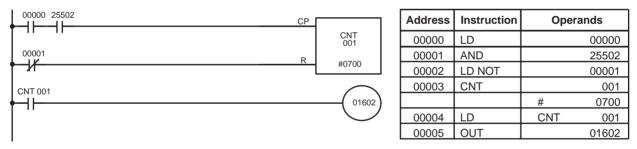

Flags

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

Example In the following example, CNT is used to create extended timers by counting SR area clock pulse bits.

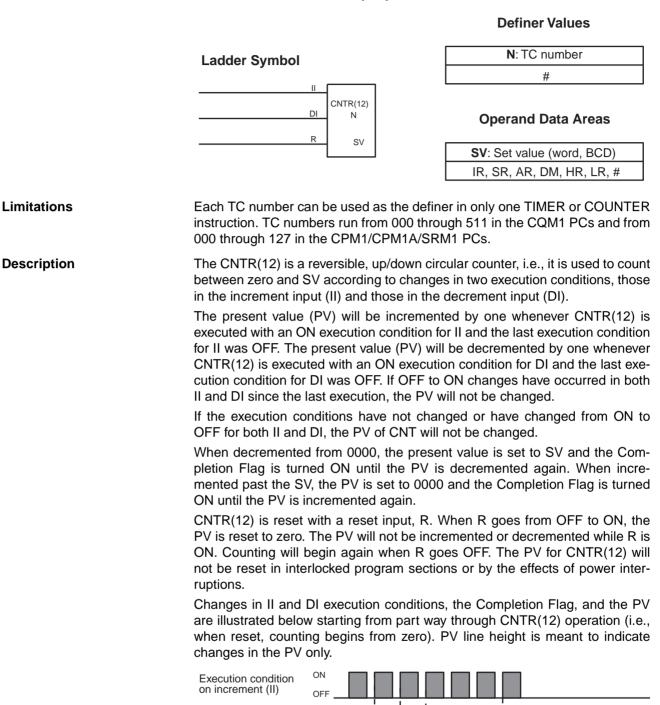

CNT 001 counts the number of times the 1-second clock pulse bit (SR 25502) goes from OFF to ON. Here again, IR 00000 is used to control the times when CNT is operating.

Because in this example the SV for CNT 001 is 700, the Completion Flag for CNT 002 turns ON when 1 second x 700 times, or 11 minutes and 40 seconds have expired. This would result in IR 01602 being turned ON.

▲ Caution The shorter clock pulses will not necessarily produce accurate timers because their short ON times might not be read accurately during longer cycles. In particular, the 0.02-second and 0.1-second clock pulses should not be used to create timers with CNT instructions.

Precautions

Program execution will continue even if a non-BCD SV is used, but the SV will not be correct.

Flags

ER: SV is not in BCD.

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

5-15-4 HIGH-SPEED TIMER – TIMH(15)

N: TC number Ladder Symbol # TIMH(15) N SV **Operand Data Areas** SV: Set value (word, BCD) IR, SR, AR, DM, HR, LR, # Limitations SV is between 00.00 and 99.99. (Although 00.00 and 00.01 may be set, 00.00 will disable the timer, i.e., turn ON the Completion Flag immediately, and 00.01 is not reliably scanned.) The decimal point is not entered. Each TC number can be used as the definer in only one TIMER or COUNTER instruction. Use TC numbers from 000 through 015 in the CQM1 PCs and from 000 through 003 in the CPM1/CPM1A/SRM1 PCs. High-speed timers with timer numbers TC 016 through TC 511 (TC 004 through TC 127 in the CPM1/CPM1A/SRM1) should not be used if the cycle time exceeds 10 ms. Description TIMH(15) operates in the same way as TIM except that TIMH measures in units of 0.01 second. Refer to 5-15-1 TIMER - TIM for operational details. Precautions Timers in interlocked program sections are reset when the execution condition for IL(02) is OFF. Power interruptions also reset timers. If a timer that is not reset under these conditions is desired, SR area clock pulse bits can be counted to produce timers using CNT. Refer to 5-15-2 COUNTER - CNT for details. Timers in jumped program sections will not be reset when the execution condition for JMP(04) is OFF, but the timer will stop timing if jump number 00 is used. The timers will continue timing if jump numbers 01 through 99 (01 through 49 in CPM1/CPM1A/SRM1 PCs) are used. Note The timer set value must be BCD between #0000 and #9999. Operation will be as follows if #0000 or #0001 is set. • If #0000 is set, the Completion Flag will turn ON as soon as the timer's execution condition turns ON (but there may be a delay if TIM 000 to TIM 015 are used). • If #0001 is set, the Completion Flag may turn ON as soon as the timer's execution condition turns ON because timer accuracy is 0 to -0.01 s. Consider the timer accuracy (0 to -0.01 s) when determining the proper set value.

Section 5-15

Definer Values

CQM1 Precautions

High-speed timers with timer numbers TC 000 through TC 015 will not be inaccurate when the PC Setup (DM 6629) is set to perform interrupt processing on these timers.

High-speed timers with timer numbers TC 016 through TC 511 will be inaccurate when the cycle time exceeds 10 ms. If the cycle time is greater than 10 ms, use TC 000 through TC 015 and set DM 6629 for interrupt processing of the timer numbers used.

Flags

ER: SV is not in BCD.

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

Example

The following example shows a timer set with a constant. 01600 will be turned ON after 00000 goes ON and stays ON for at least 1.5 seconds. When 00000 goes OFF, the timer will be reset and 01600 will be turned OFF.

Address	Instruction	Operands
00000	LD	00000
00001	TIMH(15)	000
		# 0150
00002	LD	TIM 000
00003	OUT	01600

5-15-5 INTERVAL TIMER – STIM(69)

Ladder Symbols

Operand	Data	Areas
---------	------	-------

				C1: Control data #1
	STIM(69)		@STIM(69)	000 to 008, 010 to 012
	C1		C1	
				C2: Control data #2
	C2		C2	IR, SR, AR, DM, HR, TC, LR, #
	C3		C3	
I		1 1		C3: Control data #3
				IR, SR, AR, DM, HR, TC, LR, #

	Note	STIM(69) is an expansion instruction for the SRM1. The function code 69 is the factory setting and can be changed for the SRM1 if desired.
Limitations (CQM1)		C1 must be 000 to 008 or 010 to 012. If C1 is 000 to 005, a constant greater than 0255 cannot be used for C3. If C1 is 006 to 008, constants and DM 6143 to DM 6655 cannot be used for C2 or C3. If C1 is 010 to 012, both C2 and C3 must be set to 000.
Limitations (CPM1/CPM1A/SRM1)		C1 must be 000, 003, 006. or 010. If C1 is 000 or 003, a constant greater than 0049 cannot be used for C3. If C1 is 006, constants and DM 6143 to DM 6655 cannot be used for C2 or C3. If C1 is 010, both C2 and C3 must be set to 000.
Description		STIM(69) is used to control the interval timers by performing four basic func- tions: starting the timer for a non-shot interrupt, starting the timer for sched- uled interrupts, stopping the timer, and reading the timer's PV. Set the value of C1 to specify which of these functions will be performed and which of the three interval timers it will be performed on, as shown in the following table.

Function	Timer	C1 value	Applicable PCs
Starting timers	0	000	CQM1/CPM1/ CPM1A/SRM1
	1	001	CQM1 only
	2	002	
Starting scheduled interrupts	0	003	CQM1/CPM1/ CPM1A/SRM1
	1	004	CQM1 only
	2	005	
Reading timer PV	0	006	CQM1/CPM1/ CPM1A/SRM1
	1	007	CQM1 only
	2	008	
Stopping timers	0	010	CQM1/CPM1/ CPM1A/SRM1
	1	011	CQM1 only
	2	012	

Refer to 1-5-4, 1-6-4, and 1-7-2 for more detailed descriptions of using interval timer interrupts. STIM(69) is also described in more detail after the table.

Note 1. In CQM1 PCs, interval timer 0 cannot be used when a pulse output is being output by the SPED(64) instruction.

 In CQM1 PCs, interval timer 2 cannot be used when high-speed counter 0 operation has been enabled in DM 6642 of the PC Setup.

Starting Interrupts Set C1=000 to 002 to start timers 0 to 2 to activate a one-shot interrupt. Set C1=003 to 005 to start scheduled interrupts using timers 0 to 2.

C2, which specifies the timer's SV, can be a constant or the first of two words containing the SV. The settings are slightly different depending on the method used.

If C2 is a constant, it specifies the initial value of the decrementing counter (BCD, 0000 to 9999). The decrementing time interval is 1 ms.

If C2 is a word address, C2 specifies the initial value of the decrementing counter (BCD, 0000 to 9999), and C2+1 specifies the decrementing time interval (BCD, 0005 to 0320) in units of 0.1 ms. The decrementing time interval can thus be 0.5 to 32 ms.

C3 specifies subroutine number 0000 to 0255 (0000 to 0127 in the CQM1-CPU11/21-E, 0000 to 0049 in the CPM1/CPM1A/SRM1 PCs).

Note The time required from interval timer start-up to time-up is: (the content of C2) \times (the content of C2+1) \times 0.1 ms

Reading Timer PVs Set C1=006 to 008 to read the PVs of timers 0 to 2.

C2 specifies the first of two destination words that will receive the timer's PV. C2 will receive the number of times the decrementing counter has been decremented (BCD, 0000 to 9999) and C2+1 will receive the decrementing time interval (BCD in 0.1 ms units).

C3 specifies the destination word that will receive the time which has elapsed since the last time the timer was decremented (BCD in 0.1 ms units). (Must be equal to or less than the decrementing time interval set in C2+1.)

Note The time that has elapsed since the timer was started is computed as follows: (Content of C2 × (Content of C2 + 1) + Content of C3) × 0.1 ms

Stopping Timers

Set C1=010 to 012 to stop timers 0 to 2.

C2 and C3 have no function and should both be set to 000.

Flags

ER: Interval timer 0 is started while a pulse output is operating. (C1=000 only) Interval timer 2 is started while the high-speed counter 0 is enabled (C1=002 only) Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

A data area boundary has been exceeded.

5-15-6 REGISTER COMPARISON TABLE – CTBL(63)

Ladder Symbols

Operand Data Areas

				P: Port specifier
	CTBL(63)	@CTBL(63)		000, 001, or 002
	Р	Р		
	•			C: Control data
	С	С		000 to 003
	TD	TD		
l	ТВ	ТВ	l j	TB : First comparison table word
				IR, SR, AR, DM, HR, LR

This instruction is not available for SRM1 PCs.

Limitations

The first and last comparison table words must be in the same data area. (The length of the comparison table varies according to the settings.)

In the CQM1-CPU43-EV1, CTBL(63) cannot be used if the PC Setup (DM 6611) is set to pulse output mode.

In the CPM1/CPM1A PCs, P must be 000.

Description

When the execution condition is OFF, CTBL(63) is not executed. When the execution condition is ON, CTBL(63) registers a comparison table for use with the high-speed counter PV. Depending on the value of C, comparison with the high-speed counter PV can begin immediately or it can be started separately with INI(61).

The port specifier (P) specifies the high-speed counter that will be used in the comparison.

Р	Function	Applicable PCs		
000	Specifies high-speed counter 0.	CQM1/CPM1/CPM1A		
001	Specifies high-speed counter 1.	CQM1 only		
002	Specifies high-speed counter 2.			

The function of CTBL(63) is determined by the control data, C, as shown in the following table. These functions are described after the table.

С	CTBL(63) function		
000	Registers a target value comparison table and starts comparison.		
001	Registers a range comparison table and starts comparison.		
002	Registers a target value comparison table. Start comparison with INI(61).		
003	Registers a range comparison table. Start comparison with INI(61).		

When the PV agrees with a target value or falls within a specified range, the specified subroutine is called and executed. Refer to 1-5-5 High-speed

Counter 0 Interrupts (CQM1 PCs) or *1-6-5 High-speed Counter Interrupts* (CPM1/CPM1A PCs) for more details on table comparison.

If the high-speed counter is enabled in the PC Setup (DM 6642), it will begin counting from zero when the CQM1 begins operation. The PV will not be compared to the comparison table until the table is registered and comparison is initiated with INI(61) or CTBL(63). Comparison can be stopped and started, or the PV can be reset with INI(61).

Once a comparison table has been registered, it is valid until the CQM1 is halted or until a error occurs in attempting to register a new table. The differentiated form of CTBL(63) is recommended when possible to reduce cycle time.

Target Value Comparison A target value comparison table contains up to sixteen target values. For the CQM1-CPU4□-EV1 CPU Units, up to 48 target values can be registered. A subroutine number is also registered for each target value. The corresponding subroutine is called and executed when the PV matches a target value. (When interrupt processing is not required, an undefined subroutine number may be entered.)

Target value comparisons are performed one item at a time in order of the comparison table. When the PV reaches the first target value in the table, the interrupt subroutine is executed and comparison continues to the next value in the table. When processing has been completed for the last target value in the table, comparison returns to the first value in the table and the process is repeated.

The following diagram shows the structure of a target value comparison table for use with high-speed counter 0, or high-speed counters 1 or 2 in linear mode.

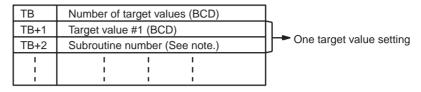

ТВ	Number of target values (BCD)	
TB+1	Target value #1, lower 4 digits (BCD)	Π
TB+2	Target value #1, upper 4 digits (BCD)	One target value setting
TB+3	Subroutine number (See note.)	

The following diagram shows the structure of a target value comparison table for use with high-speed counters 1 or 2 in ring mode. Input the target values in ascending or descending order.

The ring value specifies the number of points in the ring and the maximum count value (ring value = max. count value+1). Do not change the ring value while a comparison is in progress.

TB	Ring value, lower 4 digits (BCD)	
TB+1	Ring value, upper 4 digits (BCD)	Ring value setting
TB+2	Number of target values (BCD)	
TB+3	Target value #1, lower 4 digits (BCD)	
TB+4	Target value #1, upper 4 digits (BCD)	One target value setting
TB+5	Subroutine number (See note.)	
I I		
1 1		

The following diagram shows the structure of a target value comparison table for use with absolute high-speed counters 1 and 2 (CQM1-CPU44-E/-EV1 only). Input the target values in ascending or descending order.

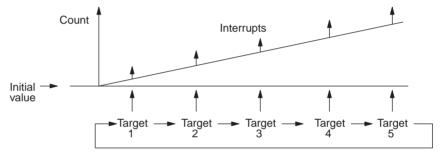

Note 1. The subroutine number can be 0000 to 0049 for CPM1/CPM1A PCs. In CQM1 PCs, the subroutine number can be F000 to F255 (F000 to F127 for the CQM1-CPU11/21-E) to activate the subroutine when decrementing and can be 0000 to 0255 (0000 to 0127 for the CQM1-CPU11/21-E) to activate the subroutine when incrementing.

2. Allow an interval of at least 0.2 ms for interrupt processing when setting the target value for high-speed counters 1 and 2.

Target Value Comparison Operation

The following diagram illustrates the operation of target value comparisons for target values 1 through 5 set consecutively in the comparison table.

As illustrated above, the current count is compared with each target value in the order that they are registered in the target value comparison table. When the count is the same as the current target value, an interrupt is generated, and comparison starts with the next target value. When all target values in the comparison table have been matched and interrupts for them generated, the target value is reset to the first target value in the table and the operation is repeated.

Range Comparison A range comparison table contains 8 ranges which are defined by an 8-digit lower limit and an 8-digit upper limit, as well as their corresponding subroutine numbers. The corresponding subroutine is called and executed when the PV falls within a given range. (When interrupt processing is not required, an undefined subroutine number may be entered.)

Always set 8 ranges. If fewer than 8 ranges are needed, set the remaining subroutine numbers to FFFF. If more than 8 ranges are needed, another comparison instruction such as BCMP(68) can be used to compare ranges with the high-speed counter PVs in IR 230 through IR 235 (SR 248 and SR 249 in CPM1/CPM1A PCs). Bear in mind that these words are refreshed just once each cycle.

There are flags in the AR area which indicate when a high-speed counter's PV falls within one or more of the 8 ranges. The flags turn ON when a PV is within the corresponding range.

Counter	AR area flags
High-speed counter 0	AR 1100 to AR 1107 correspond to ranges 1 to 8.
High-speed counter 1	AR 0500 to AR 0507 correspond to ranges 1 to 8.
High-speed counter 2	AR 0600 to AR 0607 correspond to ranges 1 to 8.

Note CPM1/CPM1A PCs are equipped with high-speed counter 0 only.

The following diagram shows the structure of a range comparison table for use with high-speed counter 0, or high-speed counters 1 or 2 in linear mode.

TB	Lower limit #1, lower 4 digits (BCD)	
TB+1	Lower limit #1, upper 4 digits (BCD)

TB+4	Subroutine number (See note 1.)	
1		
TB+35	Lower limit #8, lower 4 digits (BCD)	
TB+36	Lower limit #8, upper 4 digits (BCD)	
TB+37	Upper limit #8, lower 4 digits (BCD)	Eighth range setting
TB+38	Upper limit #8, upper 4 digits (BCD)	
TB+39	Subroutine number (See note 1.)	

The following diagram shows the structure of a range comparison table for use with high-speed counters 1 or 2 in ring mode (CQM1 only). The ring value specifies the number of points in the ring and the maximum count value (ring value = max. count value+1). Do not change the ring value while a comparison is in progress.

TB	Ring value, lower 4 digits (BCD)	
TB+1	Ring value, upper 4 digits (BCD)	Ring value setting
TB+3	Lower limit #1, lower 4 digits (BCD)]
TB+4	Lower limit #1, upper 4 digits (BCD)	
TB+5	Upper limit #1, lower 4 digits (BCD)	First range setting
TB+6	Upper limit #1, upper 4 digits (BCD)	
TB+7	Subroutine number (See note 1.)	
TB+37	Lower limit #8, lower 4 digits (BCD)	1
TB+37 TB+38	Lower limit #8, lower 4 digits (BCD) Lower limit #8, upper 4 digits (BCD)]
		← Eighth range setting
TB+38	Lower limit #8, upper 4 digits (BCD)	Eighth range setting

The following diagram shows the structure of a range comparison table for use with absolute high-speed counters 1 and 2 (CQM1-CPU44-E/-EV1 only).

ТВ	Lower limit #1(BCD)	Π
TB+2	Upper limit #1 (BCD)	First range setting
TB+4	Subroutine number (See note 2.)	
		-
TB+21	Lower limit #8 (BCD)	
TB+22	Upper limit #8 (BCD)	Eighth range setting
TB+23	Subroutine number (See note 2.)	

Note 1. The subroutine number can be 0000 to 0255 (0000 to 0127 for the CQM1-CPU11/21-E, 0000 to 0049 for the CPM1/CPM1A) and the subroutine will be executed as long as the counter's PV is within the specified range. A value of FFFF indicates that no subroutine is to be executed.

- 2. The subroutine number can be 0000 to 0255 (0000 to 0127 for the CQM1-CPU11/21-E, 0000 to 0049 for the CPM1/CPM1A) to activate the subroutine when incrementing.
- Allow a time interval of at least 2 ms between the lower and upper limits (upper limit – lower limit > 0.002 × input pulse frequency) in range comparisons with high-speed counters 1 and 2.

The following table shows the possible values for target values, lower limit values, and upper limit values. The hexadecimal value F in the most significant digit of indicates that the value is negative.

Counter	Possible values			
High-speed counter 0	Up/Down mode: F003 2767 to 0003 2767 Incrementing mode: 0000 0000 to 0006 5535			
High-speed counters 1 and 2	Linear mode: F838 8607 to 0838 8607 Ring mode: 0000 0000 to 0006 4999			
Absolute high-speed counters 1 and 2	BCD mode: 0000 to 4095 360° mode: 0000 to 0355 (5° units)			

In 360° mode the absolute high-speed counter's angular values are internally converted to binary values. The binary value after conversion depends on the resolution selected in the PC Setup (DM 6643 and/or DM 6644). The following table shows the converted values for 5° to 45° .

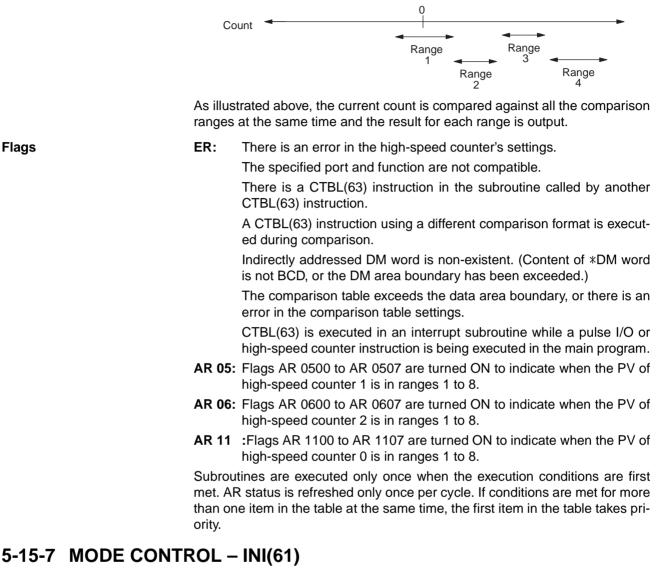

Resolution	Converted value								
	5°	10 °	15°	20 °	25 °	30 °	35°	40 °	45 °
8-bit (0 to 255)	4	7	11	14	18	21	25	28	32
10-bit (0 to 1023)	14	28	43	57	71	85	100	114	128
12-bit (0 to 4095)	57	114	171	228	284	341	398	455	512

For higher values, find the converted value to the nearest 45° and add the remainder from the table. For example, to convert 145° into 8-bit resolution: 32×3 (for 135°) + 7 (for 10°) = 103.

Caution With 10-bit and 12-bit resolution, interrupt processing might not be triggered when the angular value matches the comparison value because the converted values do not match exactly.

Range Comparison Operation

The following diagram illustrates the operation of range comparisons for range settings 1 through 4 set consecutively in the comparison table.

Ladder Symbols

INI(61)

Ρ

С

P1

@ INI(61) P C P1

Operand Data Areas

P: Port specifier
000, 001, or 002
C: Control data
000 to 003
P1: First PV word
IR, SR, AR, DM, HR, LR

This instruction is not available for SRM1 PCs.

Limitations

In the CPM1/CPM1A PCs, P must be 000 and C must be 000 to 003. In CQM1 PCs, P must be 000, 001, or 002 and C must be 000 to 003. P1 must be 000 unless C is 002.

Ring Mode

00000000 to 00064999

P1 and P1+1 must be in the same data area.

DM 6143 to DM 6655 cannot be used for P1.

Description When the execution condition is OFF, INI(61) is not executed. When the execution condition is ON, INI(61) is used to control high-speed counter operation and stop pulse output.

The port specifier (P) specifies the high-speed counter or pulse output that will be controlled.

Р	Function				
000	Specifies high-speed counter 0 or a pulse output from a bit.				
001	Specifies high-speed counter 1 or a pulse output from port 1.				
002	Specifies high-speed counter 2 or a pulse output from port 2.				

Note CPM1/CPM1A PCs are equipped with high-speed counter 0 only.

The function of INI(61) is determined by the control data, C. (P1 and P1+1 contain the new high-speed counter PV when changing the PV.)

С	P1	INI(61) function
000	000	Starts CTBL(63) table comparison.
001	000	Stops CTBL(63) table comparison.
002	New high-speed counter PV	Changes high-speed counter PV.
003	000	Stops pulse output.

CTBL(63) Table Comparison	If C is 000 or 001, INI(61) starts or stops comparison of the high-speed counter's PV to the comparison table registered with CTBL(63). Refer to 1-5-5 High-speed Counter 0 Interrupts (CQM1 PCs) or 1-6-5 High-speed Counter Interrupts (CPM1/CPM1A PCs) for details on table comparison.
PV Change	If C is 002, INI(61) changes the high-speed counter's PV to the 8-digit value in

If C is 002, INI(61) changes the high-speed counter's PV to the 8-digit value in P1 and P1+1.

With high-speed counter 0, the PV can be F003 2767 to 0003 2767 in Up/ Down Mode, or 0000 0000 to 0006 5535 in Incremental Mode. The hexadecimal value F in the most significant digit of PV indicates that PV is negative.

 Leftmost 4 digits
 Rightmost 4 digits
 Up/Down Mode
 Incrementing Mode

 P1+1
 P1
 F0032767 to 00032767
 00000000 to 00065535

With high-speed counters 1 and 2 (CQM1 only), the PV can be F838 8607 to 0838 8607 in Linear Mode, or 0000 0000 to 0006 4999 in Ring Mode.

The hexadecimal value F in the most significant digit of PV indicates that PV is negative.

Leftmost 4 digits Rightmost 4 digits Linear Mode P1+1 P1 F8388607 to 08388607 (-8,388,607 to 8,388,607)

Note The PV of absolute high-speed counters 1 and 2 (CQM1-CPU44-E/-EV1 only) cannot be changed.

Stop Pulse Output If C is 003, INI(61) stops pulse output. Refer to 1-3 Pulse Output Function (CQM1 Only) and 1-4 Pulse Output Function (CPM1A Only) for details on pulse output.

Flags ER: The specified port and function are not compatible. Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.) P1+1 exceeds the data area boundary. (C=002)

There is an error in the operand settings.

INI(61) is executed in an interrupt subroutine while a pulse I/O or highspeed counter instruction is being executed in the main program.

5-15-8 HIGH-SPEED COUNTER PV READ – PRV(62)

Ladder Symbols

Operand Data Areas

 PRV(62)		@PRV(62)		P: Port specifier
		P C		000, 001, or 002
Р				C: Control data
С				
0				000, 001, or 002
D		D: First destination word		
				IR, SR, AR, DM, HR, LR

This instruction is not available for SRM1 PCs.

Limitations

In the CPM1/CPM1A PCs, P and C must be 000. In CQM1 PCs, P and C must be 000, 001, or 002.

D and D+1 must be in the same data area.

DM 6143 to DM 6655 cannot be used for D.

Description When the execution condition is OFF, PRV(62) is not executed. When the execution condition is ON, PRV(62) reads data specified by P and C and writes it to D or D and D+1.

The port specifier (P) specifies the high-speed counter or pulse output.

Р	Function
000	Specifies high-speed counter 0 or a pulse output from a bit.
001	Specifies high-speed counter 1 or a pulse output from port 1.
002	Specifies high-speed counter 2 or a pulse output from port 2.

Note CPM1/CPM1A PCs are equipped with high-speed counter 0 only.

The control data, C, determines which type of data will be accessed.

С	Data	Destination word(s)
000	High-speed counter PV	D and D+1
001	Status of high-speed counter or pulse output	D
002	Range comparison results	D

High-speed Counter PV (C=000)

If C is 000, PRV(62) reads the specified high-speed counter's PV and writes the 8-digit value in D and D+1.

With high-speed counter 0, the PV can be F003 2767 to 0003 2767 in Up/ Down Mode, or 0000 0000 to 0006 5535 in Incremental Mode. The hexadecimal value F in the most significant digit of PV indicates that the PV is negative.

Leftmost 4 digits	Rightmost 4 digits	Up/Down Mode	Incrementing Mode
D+1	D	F0032767 to 00032767	00000000 to 00065535

With high-speed counters 1 and 2 (CQM1 only), the PV can be F838 8607 to 0838 8607 in Linear Mode, or 0000 0000 to 0006 4999 in Ring Mode. The

hexadecimal value F in the most significant digit of PV indicates that the PV is negative.

Leftmost 4 digits	Rightmost 4 digits	Linear Mode	Ring Mode
D+1	D	F8388607 to 08388607 (-8,388,607 to 8,388,607)	00000000 to 00064999

With absolute high-speed counters 1 and 2, the PV can be 0000 0000 to 0000 4095 in BCD Mode, or 0000 0000 to 0000 0359 in 360° Mode.

Leftmost 4 digits	Rightmost 4 digits	BCD Mode	360° Mode
D+1	D	0000 0000 to 0000 4095	0000 0000 to 0000 0359

High-speed Counter or Pulse Output Status (C=001)

Range Comparison

Results (C=002)

If C is 001 (CQM1 only), PRV(62) reads the operating status of the specified high-speed counter or pulse output and writes the data to D. Refer to *1-3-5 Determining the Status of Ports 1 and 2* for details on determining the status of pulse outputs.

The following table shows the function of bits in D for high-speed counters 1 and 2, and pulse outputs from ports 1 and 2 (CQM1-CPU43-E/-EV1 only). Bits not listed in the table are not used and will always be 0.

Bit	Function
00	High-speed counter comparison status. (0: Stopped; 1: Comparing)
01	High-speed counter underflow/overflow. (0: Normal; 1: Underflow/Overflow occurred.)
04	Deceleration of pulse frequency. (0: Not specified; 1: Specified.)
05	Total number of pulses specified. (0: Not specified; 1: Specified.)
06	Pulse output completed. (0: Not completed; 1: Completed)
07	Pulse output status (0: Stopped; 1: Outputting)

For absolute high-speed counters 1 and 2 (CQM1-CPU44-E/-EV1 only), Bit 00 of D indicates the comparison status (0: Stopped; 1: Comparing). The other bits in D (01 through 15) are not used and will always be 0.

Note These flags are in AR 05 and AR 06, but those words are normally refreshed only once each cycle, so the data obtained with PRV(62) will be more up-to-date.

If C is 002 (CQM1 only), PRV(62) reads the results of the comparison of the PV to the 8 ranges defined by CTBL(63) and writes this data to D. Bits 00 through 07 of D contain the Comparison Result flags for ranges 1 to 8. (0: Not in range; 1: In range)

Note These flags are in AR 05 and AR 06, but those words are normally refreshed only once each cycle, so the data obtained with PRV(62) will be more up-to-date.

ER: The specified port and function are not compatible.

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

D+1 exceeds the data area boundary. (C=000)

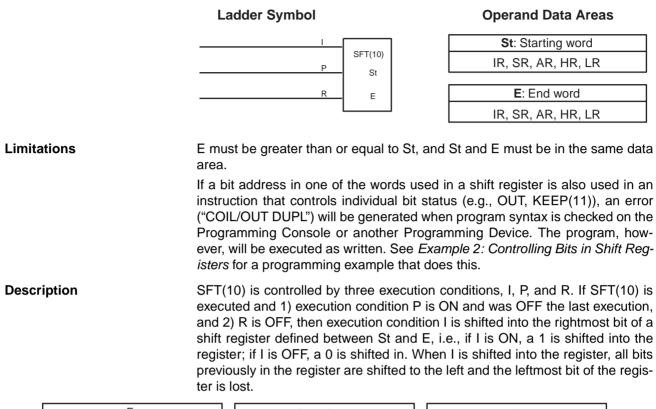

There is an error in the operand settings.

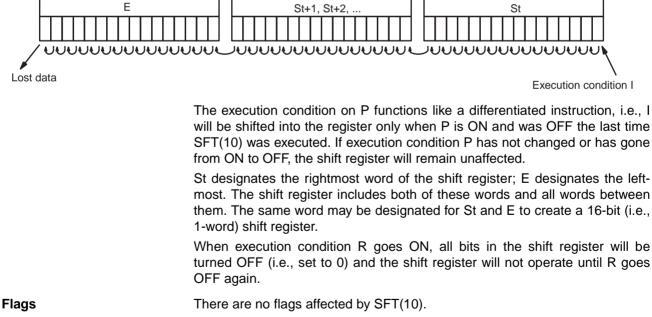

PRV(62) is executed in an interrupt subroutine while a pulse I/O or high-speed counter instruction is being executed in the main program.

Flags

5-16 Shift Instructions

5-16-1 SHIFT REGISTER – SFT(10)

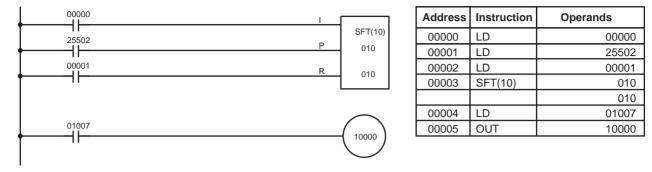

Shift Instructions

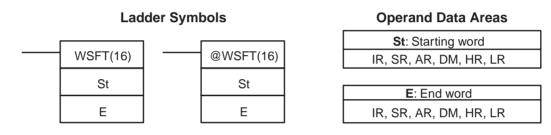

Section 5-16

Example

The following example uses the 1-second clock pulse bit (25502) so that the execution condition produced by 00000 is shifted into IR 010 every second. Output 10000 is turned ON whenever a "1" is shifted into 01007.

5-16-2 WORD SHIFT - WSFT(16)

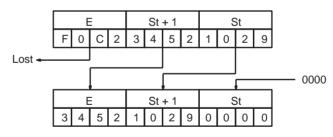

Limitations

St and E must be in the same data area, and E must be greater than or equal to St.

DM 6144 to DM 6655 cannot be used for St or E.

Description

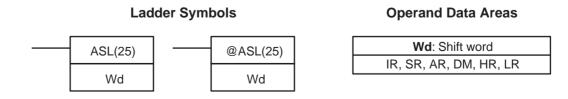

When the execution condition is OFF, WSFT(16) is not executed. When the execution condition is ON, WSFT(16) shifts data between St and E in word units. Zeros are written into St and the content of E is lost.

Flags

ER: The St and E words are in different areas, or St is greater than E. Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

5-16-3 ARITHMETIC SHIFT LEFT – ASL(25)

Limitations

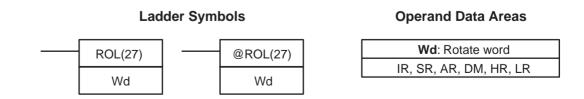

DM 6144 to DM 6655 cannot be used for Wd.

Description	When the execution condition is OFF, ASL(25) is not executed. When the exe- cution condition is ON, ASL(25) shifts a 0 into bit 00 of Wd, shifts the bits of Wd one bit to the left, and shifts the status of bit 15 into CY.		
		CY 15 1 0 0 1 1 1 0 0 0 1 0 1 0 1 1 0 0 1 1 0 0 1 0 0 1 0	
Precautions	A 0 will be shifted into bit 00 every cycle if the undifferentiated form of ASL(25) is used. Use the differentiated form (@ASL(25)) or combine ASL(25) with DIFU(13) or DIFD(14) to shift just one time.		
Flags	ER:	Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)	
	CY:	Receives the status of bit 15.	
	EQ:	ON when the content of Wd is zero; otherwise OFF.	
	.		

5-16-4 ARITHMETIC SHIFT RIGHT – ASR(26)

	Ladder Symbols		Operand Data Areas
	ASR(26)	@ASR(26)	Wd: Shift word
			IR, SR, AR, DM, HR, LR
	Wd	Wd	
Limitations	DM 614	4 to DM 6655 cannot be u	used for Wd.
Description	When the execution condition is OFF, ASR(25) is not executed. When the exe- cution condition is ON, ASR(25) shifts a 0 into bit 15 of Wd, shifts the bits of Wd one bit to the right, and shifts the status of bit 00 into CY.		
		Bit 15 1 1 0 0 1 0	Bit 00 CY 1 1 0 0 1 1 0 0 1 0
Precautions	A 0 will be shifted into bit 15 every cycle if the undifferentiated form of ASR(26) is used. Use the differentiated form (@ASR(26)) or combine ASR(26) with DIFU(13) or DIFD(14) to shift just one time.		
Flags	ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)		,
	CY:	Receives the data of bit 0	00.
	EQ: ON when the content of Wd is zero; otherwise OFF.		

5-16-5 ROTATE LEFT - ROL(27)

Shift Instructions	Section 5-16
Limitations	DM 6144 to DM 6655 cannot be used for Wd.
Description	When the execution condition is OFF, ROL(27) is not executed. When the exe- cution condition is ON, ROL(27) shifts all Wd bits one bit to the left, shifting CY into bit 00 of Wd and shifting bit 15 of Wd into CY.
	Bit Bit CY 15 0 1 1 0 1 0 1 1
Precautions	Use STC(41) to set the status of CY or CLC(41) to clear the status of CY before doing a rotate operation to ensure that CY contains the proper status before executing ROL(27).
	CY will be shifted into bit 00 every cycle if the undifferentiated form of ROL(27) is used. Use the differentiated form (@ROL(27)) or combine ROL(27) with DIFU(13) or DIFD(14) to shift just one time.
Flags	ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)
	CY: Receives the data of bit 15.
	EQ: ON when the content of Wd is zero; otherwise OFF.

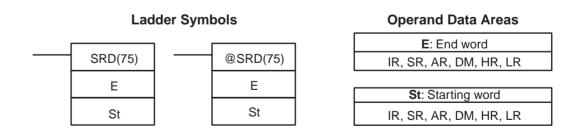

5-16-6 ROTATE RIGHT – ROR(28)

	Ladder S	Symbols	Operand Data Areas
	ROR(28) Wd	@ROR(28) Wd	Wd: Rotate word IR, SR, AR, DM, HR, LR
Limitations	DM 6144 to D	M 6655 cannot be used for	Wd.
Description	execution con		COR(28) is not executed. When the sall Wd bits one bit to the right, shift- o of Wd into CY.
		CY 15 0 0 1 0 1 0 1 0 0	Bit 00 0 1 1 1 1 0 0 0 1
Precautions		a rotate operation to ensure	CLC(41) to clear the status of CY that CY contains the proper status
	ROR(28) is u		ycle if the undifferentiated form of ed form (@ROR(28)) or combine hift just one time.
Flags		ctly addressed DM word is BCD, or the DM area bound	non-existent. (Content of *DM word dary has been exceeded.)
		ves the data of bit 00.	-
	EQ: ON wi	nen the content of Wd is ze	ro; otherwise OFF.

5-16-7 ONE DIGIT SHIFT LEFT – SLD(74)

	Ladder Sym	bols	Operand Data Areas
			St: Starting word
	SLD(74)	@SLD(74)	IR, SR, AR, DM, HR, LR
	St	St	E. End word
	E	E	E: End word
			IR, SR, AR, DM, HR, LR
Limitations	St and E must be to St.	in the same data area, a	nd E must be greater than or equal
	DM 6144 to DM 66	655 cannot be used for S	t or E.
Description	cution condition is one digit (four bits	ON, SLD(74) shifts dat	74) is not executed. When the exe- a between St and E (inclusive) by to the rightmost digit of the St, and
		E 8 F C 5 ··· D	
		Lost data	0
Precautions		occurs during a shift ope might not be completed.	ration across more than 50 words,
	entiated form of S		ligit of St every cycle if the undiffer- differentiated form (@SLD(74)) or 4) to shift just one time.
Flags	Indirectly		areas, or St is greater than E. on-existent. (Content of *DM word ary has been exceeded.)

5-16-8 ONE DIGIT SHIFT RIGHT – SRD(75)

Limitations

St and E must be in the same data area, and E must be less than or equal to St.

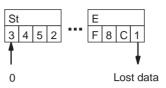

DM 6144 to DM 6655 cannot be used for St or E.

Description

When the execution condition is OFF, SRD(75) is not executed. When the execution condition is ON, SRD(75) shifts data between St and E (inclusive) by one digit (four bits) to the right. 0 is written into the leftmost digit of St and the rightmost digit of E is lost.

Section 5-16

Operand Data Areas

Precautions If a power failure occurs during a shift operation across more than 50 words, the shift operation might not be completed.

A 0 will be shifted into the most significant digit of St every cycle if the undifferentiated form of SRD(75) is used. Use the differentiated form (@SRD(75)) or combine SRD(75) with DIFU(13) or DIFD(14) to shift just one time.

Flags

ER: The St and E words are in different areas, or St is less than E. Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

5-16-9 REVERSIBLE SHIFT REGISTER – SFTR(84)

					Operand Data Areas
		C: Control word			
	[1	r	,	IR, SR, AR, DM, HR, LR
	SFTR(84)		@SFTR(84)		
	. ,			Η Γ	St: Starting word
	С		С		IR, SR, AR, DM, HR, LR
	St		St		
	51	ļ		4	E: End word
	E		E		IR, SR, AR, DM, HR, LR

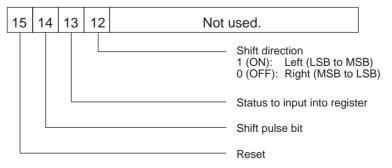

Limitations

St and E must be in the same data area and St must be less than or equal to E.

DM 6144 to DM 6655 cannot be used for C, St, or E.

Description

SFTR(84) is used to create a single- or multiple-word shift register that can shift data to either the right or the left. To create a single-word register, designate the same word for St and E. The control word provides the shift direction, the status to be put into the register, the shift pulse, and the reset input. The control word is allocated as follows:

The data in the shift register will be shifted one bit in the direction indicated by bit 12, shifting one bit out to CY and the status of bit 13 into the other end whenever SFTR(84) is executed with an ON execution condition as long as

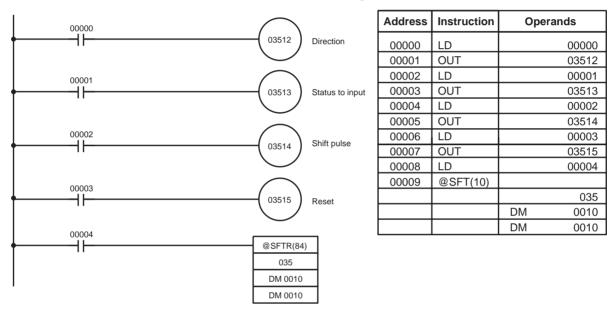

the reset bit is OFF and as long as bit 14 is ON. If SFTR(84) is executed with an OFF execution condition or if SFTR(84) is executed with bit 14 OFF, the shift register will remain unchanged. If SFTR(84) is executed with an ON execution condition and the reset bit (bit 15) is OFF, the entire shift register and CY will be set to zero.

Flags

ER: St and E are not in the same data area or ST is greater than E. Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

CY: Receives the status of bit 00 of St or bit 15 of E, depending on the shift direction.

In the following example, IR 00000, IR 00001, IR 00002, and IR 00003 are used to control the bits of C used in @SFTR(84). The shift register is in DM 0010, and it is controlled through IR 00004.

5-16-10 ASYNCHRONOUS SHIFT REGISTER – ASFT(17)

Ladder Symbols			C: Control word IR, SR, AR, DM, HR, LR, #	
A	SFT(17)		@ASFT(17)	St: Starting word
	С		С	IR, SR, AR, DM, HR, LR
	St		St	E: End word
	E		E	IR, SR, AR, DM, HR, LR

Note ASFT(17) is an expansion instruction for the SRM1. The function code 17 is the factory setting and can be changed for the SRM1 if desired.

Limitations

St and E must be in the same data area, and E must be greater than or equal to St.

DM 6144 to DM 6655 cannot be used for St or E.

Example

Operand Data Areas

Description		When the execution condition is OFF, ASFT(17) does nothing and the pro- gram moves to the next instruction. When the execution condition is ON, ASFT(17) is used to create and control a reversible asynchronous word shift register between St and E. This register only shifts words when the next word in the register is zero, e.g., if no words in the register contain zero, nothing is shifted. Also, only one word is shifted for each word in the register that con- tains zero. When the contents of a word are shifted to the next word, the origi- nal word's contents are set to zero. In essence, when the register is shifted, each zero word in the register trades places with the next word. (See <i>Example</i> below.) The shift direction (i.e. whether the "next word" is the next higher or the next lower word) is designated in C. C is also used to reset the register. All of any portion of the register can be reset by designating the desired portion with St and E.				
Control Word	lote	ON to s higher enable ister. B and E operati	through 12 of C are not used. Bit 13 is the shift direction: turn bit 13 shift down (toward lower addressed words) and OFF to shift up (toward addressed words). Bit 14 is the Shift Enable Bit: turn bit 14 ON to shift register operation according to bit 13 and OFF to disable the regit 15 is the Reset bit: the register will be reset (set to zero) between St when ASFT(17) is executed with bit 15 ON. Turn bit 15 OFF for normal on.			
		cycle while the execution condition is ON. Use the differentiated form to pre- vent this.				
Flags		ER:	The St and E words are in different areas, or St is greater than E.			
		Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)				
Example		The following example shows instruction ASFT(17) used to shift words in an 11-word shift register created between DM 0100 and DM 0110 with C=#6000. Non-zero data is shifted towards St (DM 0110).				

		X	- /		
00000	ASFT(17)	Address	Instruction	Оре	rands
	#6000	00000	LD		00000
	DM 0100	00001	ASFT(17)		
	DM 0110			#	6000
	DIVIOTIO			DM	0100
				DM	0110

	Before execution		After one execution	-	After sev executio	
DM 0100	1234		1234		1234	
DM 0101	0000		0000		2345	
DM 0102	0000		2345		3456	
DM 0103	2345		0000		4567	
DM 0104	3456		3456		5678	
DM 0105	0000		4567		6789	
DM 0106	4567	\frown	0000		789A	
DM 0107	5678		5678		0000	
DM 0108	6789		6789		0000	
DM 0109	0000		789A		0000	
DM 0110	789A	\frown	0000		0000	

Note The zeroes are shifted "upward" if C=4000, and the entire shift register is set to zero if C=8000.

5-17 Data Movement Instructions

5-17-1 MOVE - MOV(21)

Operand Data Areas

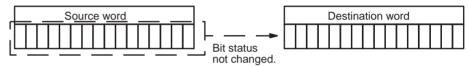

S: Source word
IR, SR, AR, DM, HR, TC, LR, #
D: Destination word
IR, SR, AR, DM, HR, LR

Limitations

DM 6144 to DM 6655 cannot be used for D.

Description

When the execution condition is OFF, MOV(21) is not executed. When the execution condition is ON, MOV(21) copies the content of S to D.

Precautions

TC numbers cannot be designated as D to change the PV of the timer or counter. You can, however, easily change the PV of a timer or a counter by using BSET(71).

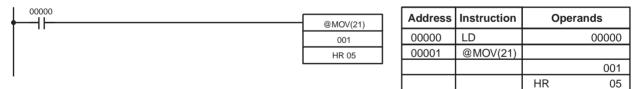

Flags

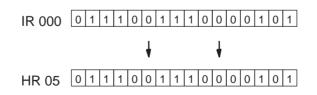

ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

EQ: ON when all zeros are transferred to D.

Example

he following example shows @MOV(21) being used to copy the content of IR 001 to HR 05 when IR 00000 goes from OFF to ON.

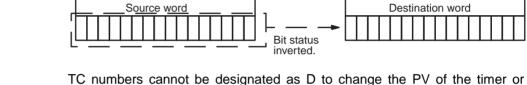

5-17-2 MOVE NOT - MVN(22)

MVN(22) @MVN(22) IR, SR, AR, DM, HR, TC, LR, # S S D: Destination word D D IR, SR, AR, DM, HR, LR DM 6144 to DM 6655 cannot be used for D.

When the execution condition is OFF, MVN(22) is not executed. When the execution condition is ON, MVN(22) transfers the inverted content of S (specified word or four-digit hexadecimal constant) to D, i.e., for each ON bit in S, the corresponding bit in D is turned OFF, and for each OFF bit in S, the corresponding bit in D is turned ON.

counter. However, these can be easily changed using BSET(71). ER:

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

EQ: ON when all zeros are transferred to D.

Example

Flags

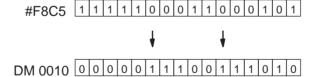

Precautions

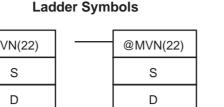

Limitations

Description

The following example shows @MVN(22) being used to copy the complement of #F8C5 to DM 0010 when IR 00001 goes from OFF to ON.

	@MVN(22)	Address	Instruction		Operands
	#F8C5	00000	LD		00001
	DM 0010	00001	@MOV(21)		
				#	F8C5
•				DM	0010

Operand Data Areas

S: Source word

5-17-3 BLOCK TRANSFER – XFER(70)

Ladder Symbols								
 XFER(70)		@XFER(70)						
Ν		Ν						
S		S						
D		D						

Operand Data Areas

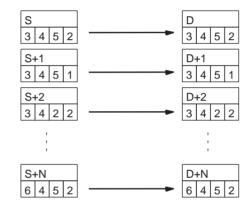

N: Number of words (BCD)
IR, SR, AR, DM, HR, TC, LR, #
S: Starting source word
IR, SR, AR, DM, HR, TC, LR
D: Starting destination word
IR, SR, AR, DM, HR, TC, LR

Limitations

Description

S and S+N must be in the same data area, as must D and D+N. DM 6144 to DM 6655 cannot be used for D.

When the execution condition is OFF, XFER(70) is not executed. When the execution condition is ON, XFER(70) copies the contents of S, S+1, ..., S+N to D, D+1, ..., D+N.

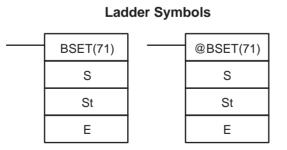

Flags

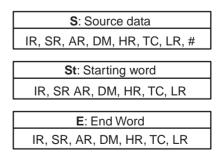

ER: N is not BCD

S and S+N or D and D+N are not in the same data area. Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

5-17-4 BLOCK SET – BSET(71)

Operand Data Areas

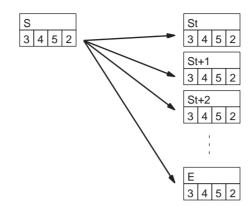

Limitations

St must be less than or equal to E, and St and E must be in the same data area.

DM 6144 to DM 6655 cannot be used for St or E.

Description

When the execution condition is OFF, BSET(71) is not executed. When the execution condition is ON, BSET(71) copies the content of S to all words from St through E.

BSET(71) can be used to change timer/counter PV. (This cannot be done with MOV(21) or MVN(22).) BSET(71) can also be used to clear sections of a data area, i.e., the DM area, to prepare for executing other instructions. It can also be used to clear words by transferring all zeros.

Flags

Example

St and E are not in the same data area or St is greater than E. Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

The following example shows how to use BSET(71) to copy a constant (#0000) to a block of the DM area (DM 0000 to DM 0500) when IR 00000 is ON.

00000

5-17-5 DATA EXCHANGE – XCHG(73)

 XCHG(73)	 @XCHG(73)	
E1	E1	
E2	E2	

Ladder Symbols

Operand Data Areas

E1: Exchange word 1
IR, SR, AR, DM, HR, TC, LR
E2: Exchange word 2

Limitations Description

DM 6144 to DM 6655 cannot be used for E1 or E2.

When the execution condition is OFF, XCHG(73) is not executed. When the execution condition is ON, XCHG(73) exchanges the content of E1 and E2.

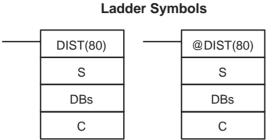

If you want to exchange content of blocks whose size is greater than 1 word, use work words as an intermediate buffer to hold one of the blocks using XFER(70) three times.

Section 5-17

Flags

ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

5-17-6 SINGLE WORD DISTRIBUTE – DIST(80)

Operand Data Areas

ools	S: Source data
	IR, SR, AR, DM, HR, TC, LR, #
@DIST(80)	
	DBs: Destination base word
S	IR, SR, AR, DM, HR, TC, LR
DBs	
003	C: Control word (BCD)
С	IR, SR, AR, DM, HR, TC, LR, #

Limitations

C must be BCD.

DM 6144 to DM 6655 cannot be used for DBs or C.

DescriptionDIST(80) can be used for single-word distribution or for a stack operation
depending on the content of the control word, C.

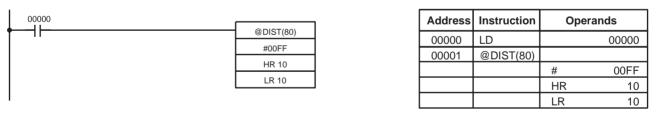

Single-word Distribution When bits 12 to 15 of C=0 to 8, DIST(80) can be used for a single word distribute operation. The entire contents of C specifies an offset, Of.

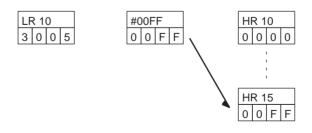

When the execution condition is OFF, DIST(80) is not executed. When the execution condition is ON, DIST(80) copies the content of S to DBs+Of, i.e., Of is added to DBs to determine the destination word.

Note DBs and DBs+Of must be in the same data area and cannot be between DM 6144 and DM 6655.

Example

The following example shows how to use DIST(80) to copy #00FF to HR 10 + Of. The content of LR 10 is #3005, so #00FF is copied to HR 15 (HR 10 + 5) when IR 00000 is ON.

Stack Operation

When bits 12 to 15 of C=9, DIST(80) can be used for a stack operation. The other 3 digits of C specify the number of words in the stack (000 to 999). The content of DBs is the stack pointer.

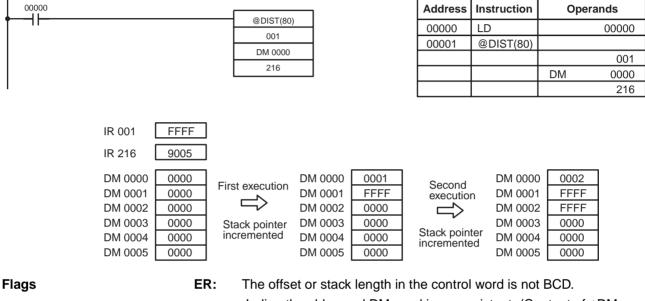

When the execution condition is OFF, DIST(80) is not executed. When the execution condition is ON, DIST(80) copies the content of S to DBs+1+the

content of DBs. In other words, 1 and the content of DBs are added to DBs to determine the destination word. The content of DBs is then incremented by 1.

- Note 1. DIST(80) will be executed every cycle unless the differentiated form (@DIST(80)) is used or DIST(80) is used with DIFU(13) or DIFD(14).
 - 2. Be sure to initialize the stack pointer before using DIST(80) as a stack operation.

Example

The following example shows how to use DIST(80) to create a stack between DM 0001 and DM 0005. DM 0000 acts as the stack pointer.

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

During stack operation, the value of the stack pointer+1 exceeds the length of the stack.

EQ: ON when the content of S is zero; otherwise OFF.

5-17-7 DATA COLLECT – COLL(81)

	F		
	COLL(81)	 @COLL(81)	
	SBs	SBs	
	С	С	
	D	D	

Operand Data Areas

SBs: Source base word
IR, SR, AR, DM, HR, TC, LR
C: Control word (BCD)
IR, SR, AR, DM, HR, TC, LR, #
D: Destination word
IR, SR, AR, DM, HR, TC, LR

Limitations

C must be BCD. DM 6144 to DM 6655 cannot be used for D.

Description

COLL(81) can be used for data collection, an FIFO stack operation, or an LIFO stack operation depending on the content of the control word, C.

Data Collection

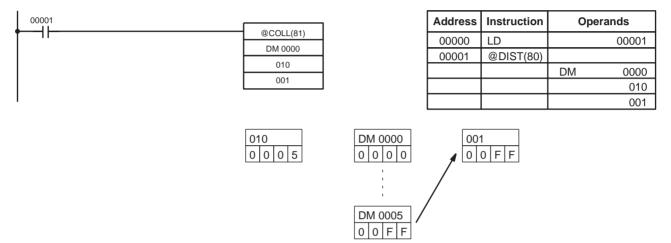

When bits 12 to 15 of C=0 to 7, COLL(81) is used for data collection. The entire contents of C specifies an offset, Of.

When the execution condition is OFF, COLL(81) is not executed. When the execution condition is ON, COLL(81) copies the content of SBs + Of to D, i.e., Of is added to SBs to determine the source word.

Note SBs and SBs+Of must be in the same data area.

Example

The following example shows how to use COLL(81) to copy the content of DM 0000+Of to IR 001. The content of 010 is #0005, so the content of DM 0005 (DM 0000 + 5) is copied to IR 001 when IR 00001 is ON.

FIFO Stack Operation

When bits 12 to 15 of C=9, COLL(81) can be used for an FIFO stack operation. The other 3 digits of C specify the number of words in the stack (000 to 999). The content of SBs is the stack pointer.

When the execution condition is ON, COLL(81) shifts the contents of each word within the stack down by one address, finally shifting the data from SBs+1 (the first value written to the stack) to the destination word (D). The content of the stack pointer (SBs) is then decremented by one.

Note COLL(81) will be executed every cycle unless the differentiated form (@COLL(81)) is used or COLL(81) is used with DIFU(13) or DIFD(14).

Example

The following example shows how to use COLL(81) to create a stack between DM 0001 and DM 0005. DM 0000 acts as the stack pointer.

When IR 00000 goes from OFF to ON, COLL(81) shifts the contents of DM 0002 to DM 0005 down by one address, and shifts the data from DM 0001 to

Data Movement Instructions

Section 5-17

one. 00000 Address Instruction Operands -11 @COLL(81) 00000 ID 00000 DM 0000 @COLL(81) 00001 216 DM 0000 001 216 001 IR 216 9005 Stack pointer decremented DM 0000 DM 0000 0005 0004 IR 001 AAAA DM 0001 AAAA DM 0001 BBBB DM 0002 BBBB DM 0002 CCCC DM 0003 CCCC DM 0003 DDDD DM 0004 DDDD DM 0004 EEEE DM 0005 EEEE DM 0005 EEEE

IR 001. The content of the stack pointer (DM 0000) is then decremented by one.

LIFO Stack Operation When bits 12 to 15 of C=8, COLL(81) can be used for an LIFO stack operation. The other 3 digits of C specify the number of words in the stack (000 to 999). The content of SBs is the stack pointer.

When the execution condition is ON, COLL(81) copies the data from the word indicated by the stack pointer (SBs+the content of SBs) to the destination word (D). The content of the stack pointer (SBs) is then decremented by one.

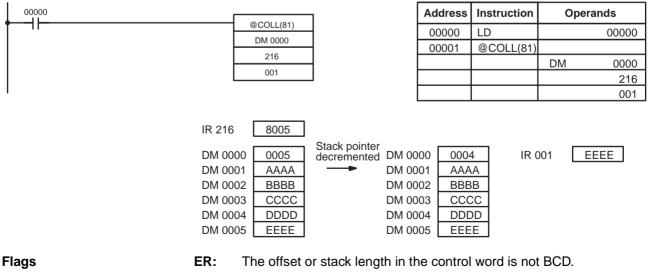

The stack pointer is the only word changed in the stack.

Note COLL(81) will be executed every cycle unless the differentiated form (@DIST(80)) is used or DIST(80) is used with DIFU(13) or DIFD(14).

Example

The following example shows how to use COLL(81) to create a stack between DM 0001 and DM 0005. DM 0000 acts as the stack pointer.

When IR 00000 goes from OFF to ON, COLL(81) copies the content of DM 0005 (DM 0000 + 5) to IR 001. The content of the stack pointer (DM 0000) is then decremented by one.

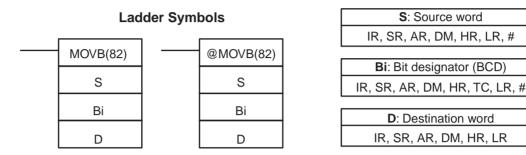

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

During stack operation, the value of the stack pointer exceeds the length of the stack; an attempt was made to write to a word beyond the end of the stack.

EQ: ON when the content of S is zero; otherwise OFF.

5-17-8 MOVE BIT - MOVB(82)

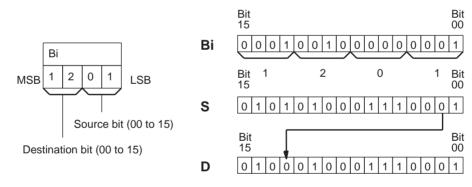

Limitations

The rightmost two digits and the leftmost two digits of Bi must each be between 00 and 15.

DM 6144 to DM 6655 cannot be used for Bi or D.

Description

When the execution condition is OFF, MOVB(82) is not executed. When the execution condition is ON, MOVB(82) copies the specified bit of S to the specified bit in D. The bits in S and D are specified by Bi. The rightmost two digits of Bi designate the source bit; the leftmost two bits designate the destination bit.

Flags

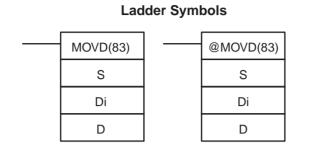

ER:

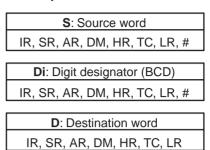

Bi is not BCD, or it is specifying a non-existent bit (i.e., bit specification must be between 00 and 15).

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

Operand Data Areas

Operand Data Areas

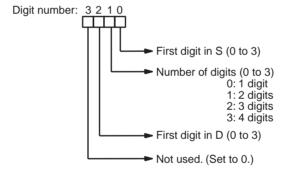

Limitations

The rightmost three digits of Di must each be between 0 and 3.

Description

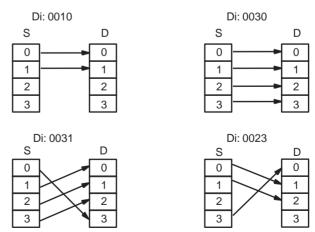

DM 6144 to DM 6655 cannot be used for Di or D. When the execution condition is OFF, MOVD(83) is not executed. When the

execution condition is ON, MOVD(83) copies the content of the specified digit(s) in S to the specified digit(s) in D. Up to four digits can be transferred at one time. The first digit to be copied, the number of digits to be copied, and the first digit to receive the copy are designated in Di as shown below. Digits from S will be copied to consecutive digits in D starting from the designated first digit and continued for the designated number of digits. If the last digit is reached in either S or D, further digits are used starting back at digit 0.

Digit Designator

The following show examples of the data movements for various values of Di.

Flags

ER: At least one of the rightmost three digits of Di is not between 0 and 3. Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

Section 5-17

5-17-10 TRANSFER BITS – XFRB(----)

XFRB(----)

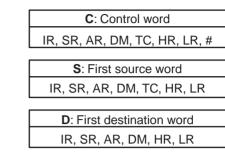

С

S

D

Ladder Symbols

Limitations

This instruction is available in the CQM1-CPU4-E/-EV1 only.

The specified source bits must be in the same data area.

@XFRB(---)

С

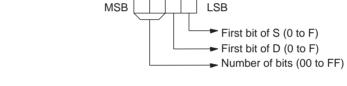

S

D

The specified destination bits must be in the same data area.

DM 6144 to DM 6655 cannot be used for D.

Description When the execution condition is OFF, XFRB(—) is not executed. When the execution condition is ON, XFRB(—) copies the specified source bits to the specified destination bits. The two rightmost digits of C specify the starting bits in S and D and the leftmost two digits indicate the number of bits that will be copied.

C

Note Up to 255 (FF) bits can be copied at one time.

Example

In the following example, XFRB(—) is used to transfer 5 bits from IR 020 and IR 021 to LR 00 and LR 01. The starting bit in IR 020 is D (13), and the starting bit in LR 00 is E (14), so IR 02013 to IR 02101 are copied to LR 0014 to LR 0102.

Operand Data Areas

CD: Compare data						
IR, SR, DM, HR, TC, LR, #						
TB: First comparison table word						
IR, SR, DM, HR, TC, LR						
R: Result word						
IR, SR, DM, HR, TC, LR						

Limitations

Description

DM 6144 to DM 6655 cannot be used for R.

When the execution condition is OFF, TCMP(85) is not executed. When the execution condition is ON, TCMP(85) compares CD to the content of TB, TB+1, TB+2, ..., and TB+15. If CD is equal to the content of any of these words, the corresponding bit in R is set, e.g., if the CD equals the content of TB, bit 00 is turned ON, if it equals that of TB+1, bit 01 is turned ON, etc. The rest of the bits in R will be turned OFF.

Flags

ER: The comparison table (i.e., TB through TB+15) exceeds the data area.

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

Comparison Instructions

Section 5-18

Example

The following example shows the comparisons made and the results provided for TCMP(85). Here, the comparison is made during each cycle when IR 00000 is ON.

5-18-6 SIGNED BINARY COMPARE - CPS(----)

Ladder Symbols

 CPS(—)
Cp1
Cp2
000

Operand Data Areas

Limitations	This ins	struction is available in the CQM1-CPU4□-E/-EV1 only.
Description	cution of	he execution condition is OFF, CPS(—) is not executed. When the exe- condition is ON, CPS(—) compares the 16-bit (4-digit) signed binary s in Cp1 and Cp2 and outputs the result to the GR, EQ, and LE flags in area.
Precautions	accesse	other instructions between CPS(—) and the operation which es the EQ, LE, and GR flags may change the status of these flags. Be access them before the desired status is changed.
Flags	ER:	Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

EQ: ON if Cp1 equals Cp2.

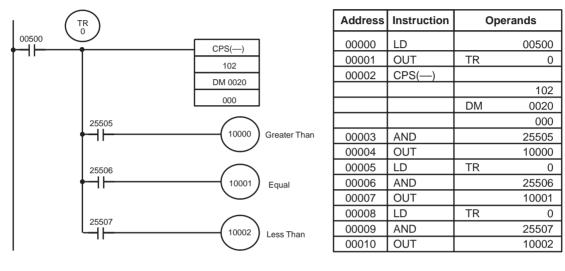

LE: ON if Cp1 is less than Cp2.

GR: N if Cp1 is greater than Cp2.

Comparison result		Flag status						
	GR (SR 25505)	EQ (SR 25506)	LE (SR 25507)					
Cp1 < Cp2	0	0	1					
Cp1 = Cp2	0	1	0					
Cp1 > Cp2	1	0	0					

Example

In the following example, the content of 102 is greater than that of DM 0020, so 10000 is turned ON and the other bits, 10001 and 10002, are turned OFF.

	Cp1	: 102			Ср	2: DI	V 002	20
6	F	Α	4	>	Α	Е	3	5
(28	,580	decin	nal)		(–2	0,939	9 dec	imal)

5-18-7 DOUBLE SIGNED BINARY COMPARE - CPSL(---)

Ladder Symbols	Operand Data Areas
	Cp1: First compare word
CPSL(—)	IR, SR, AR, DM, HR, TC, LR, #
Cp1	
	Cp2: Second compare word
Cp2	IR, SR, AR, DM, HR, TC, LR, #
000	
	000
	Not used. Set to 000.
This instruction is available in the	CQM1-CPU4□-E/-EV1 only.

Limitations

Description

When the execution condition is OFF, CPSL(---) is not executed. When the execution condition is ON, CPSL(---) compares the 32-bit (8-digit) signed binary contents in Cp1+1, Cp1 and Cp2+1, Cp2 and outputs the result to the GR, EQ, and LE flags in the SR area.

Precautions Placing other instructions between CPSL(---) and the operation which accesses the EQ, LE, and GR flags may change the status of these flags. Be sure to access them before the desired status is changed.

Flags

ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

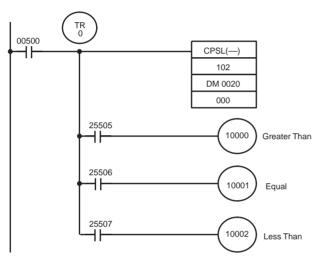

Section 5-18

- EQ: ON if Cp1+1, Cp1 equals Cp2+1, Cp2.
- LE: ON if Cp1+1, Cp1 is less than Cp2+1, Cp2.
- **GR:** ON if Cp1+1, Cp1 is greater than Cp2+1, Cp2.

Comparison result	Flag status						
	GR (SR 25505)	EQ (SR 25506)	LE (SR 25507)				
Cp1+1, Cp1 < Cp2+1, Cp2	0	0	1				
Cp1+1, Cp1 = Cp2+1, Cp2	0	1	0				
Cp1+1, Cp1 > Cp2+1, Cp2	1	0	0				

Example

In the following example, the content of 103, 102 is less than that of DM 0021, DM 0020, so 10002 is turned ON and the other bits, 10000 and 10001, are turned OFF.

5-18-8 AREA RANGE COMPARE – ZCP(---)

		· · · · · · · · · · · · · · · · · · ·
La	dder Symbol	CD: Compare data
		IR, SR, AR, DM, HR, TC, LR, #
	ZCP()	
		LL: Lower limit of range
	CD	IR, SR, AR, DM, HR, TC, LR, #
		UL: Upper limit of range
	UL	IR, SR, AR, DM, HR, TC, LR, #

(90,872,283 decimal)

Limitations

This instruction is available in the CQM1-CPU4 \square -E/-EV1 only.

LL must be less than or equal to UL.

Description

When the execution condition is OFF, ZCP(—) is not executed. When the execution condition is ON, ZCP(—) compares CD to the range defined by lower

256

limit LL and upper limit UL and outputs the result to the GR, EQ, and LE flags in the SR area. The resulting flag status is shown in the following table.

Comparison result		Flag status						
	GR (SR 25505)	EQ (SR 25506)	LE (SR 25507)					
CD < LL	0	0	1					
$LL \leq CD \leq UL$	0	1	0					
UL < CD	1	0	0					

Precautions

Placing other instructions between ZCP(—) and the operation which accesses the EQ, LE, and GR flags may change the status of these flags. Be sure to access them before the desired status is changed.

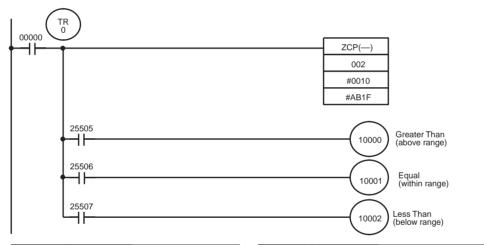

Flags

ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

- LL is greater than UL.
- **EQ:** ON if $LL \leq CD \leq UL$
- LE: ON if CD < LL.
- **GR:** ON if CD > UL.

Example

In the following example, the content of IR 002 (#6FA4) is compared to the range #0010 to #AB1F. Since $#0010 \le #6FA4 \le #AB1F$, the EQ flag and IR 10001 are turned ON.

5-19 Conversion Instructions

5-19-1 BCD-TO-BINARY – BIN(23)

Ladder Symbols

Operand Data Areas

Limitations

DM 6144 to DM 6655 cannot be used for R.

Section 5-19

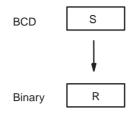

Operand Data Areas

CD: Compare data IR, SR, AR, DM, HR, LR

Ladder Symbol

Description

When the execution condition is OFF, BIN(23) is not executed. When the execution condition is ON, BIN(23) converts the BCD content of S into the numerically equivalent binary bits, and outputs the binary value to R. Only the content of R is changed; the content of S is left unchanged.

BIN(23) can be used to convert BCD to binary so that displays on the Programming Console or any other programming device will appear in hexadecimal rather than decimal. It can also be used to convert to binary to perform binary arithmetic operations rather than BCD arithmetic operations, e.g., when BCD and binary values must be added.

Flags

- ER: The content of S is not BCD. Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)
- EQ: ON when the result is zero.

5-19-2 BINARY-TO-BCD – BCD(24)

Lad	der Syml	Operand Data Areas	
			S: Source word (binary)
BCD(24)		@BCD(24)	IR, SR, AR, DM, HR, LR
S		S	
			R: Result word
R		R	IR, SR, AR, DM, HR, LR

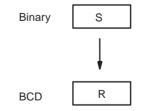

Limitations

Description

If the content of S exceeds 270F, the converted result would exceed 9999 and BCD(24) will not be executed. When the instruction is not executed, the content of R remains unchanged.

DM 6144 to DM 6655 cannot be used for R.

BCD(24) converts the binary (hexadecimal) content of S into the numerically equivalent BCD bits, and outputs the BCD bits to R. Only the content of R is changed; the content of S is left unchanged.

BCD(24) can be used to convert binary to BCD so that displays on the Programming Console or any other programming device will appear in decimal rather than hexadecimal. It can also be used to convert to BCD to perform BCD arithmetic operations rather than binary arithmetic operations, e.g., when BCD and binary values must be added. Flags

- . . . 10 ER Ч
 - ON when the result is zero.

5-19-3 DOUBLE BCD-TO-DOUBLE BINARY – BINL(58)

BINL(58)

c

		S	
			R: First result word
	R	R	IR, SR, AR, DM, HR, LR
Limitations	This instr	ruction is available in the	e CQM1 only.
	DM 6143	to DM 6655 cannot be	used for R.
Description	execution	n condition is ON, BINL	S OFF, BINL(58) is not executed. When the (58) converts an eight-digit number in S and putputs the converted data to R and R+1.
		BCD	S + 1 S
			Ļ
		Binary	R + 1 R
Flags	ER: T	The contents of S and/or	S+1 words are not BCD.

@BINL(58)

ER: The contents of S and/or S+1 words are not BCD. Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

EQ: ON when the result is zero.

5-19-4 DOUBLE BINARY-TO-DOUBLE BCD – BCDL(59)

Ladder Symbols					Operand Data Areas
				ן	S: First source word (binary)
	BCDL(59)		@BCDL(59)		IR, SR, AR, DM, HR, LR
	S		S		
				1	R: First result word
	R		R	J	IR, SR, AR, DM, HR, LR

Limitations

This instruction is available in the CQM1 only.

If the content of S exceeds 05F5E0FF, the converted result would exceed 99999999 and BCDL(59) will not be executed. When the instruction is not executed, the content of R and R+1 remain unchanged. DM 6143 to DM 6655 cannot be used for R.

Operand Data Areas

S: First source word (BCD)

IR, SR, AR, DM, HR, TC, LR

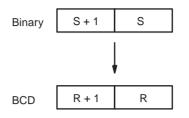

R:	Indirectly addressed DM word is non-existent. (Content of *DM word
	is not BCD, or the DM area boundary has been exceeded.)
_	_

EQ:

Ladder Symbols

Description

BCDL(59) converts the 32-bit binary content of S and S+1 into eight digits of BCD data, and outputs the converted data to R and R+1.

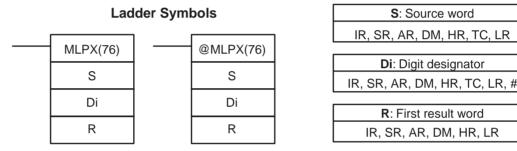

Flags

ER: Content of R and R+1 exceeds 99999999. Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

EQ: ON when the result is zero.

5-19-5 4-TO-16 DECODER – MLPX(76)

Limitations

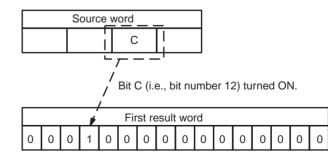

The rightmost two digits of Di must each be between 0 and 3.

All result words must be in the same data area.

DM 6144 to DM 6655 cannot be used for R.

Description When the execution condition is OFF, MLPX(76) is not executed. When the execution condition is ON, MLPX(76) converts up to four, four-bit hexadecimal digits from S into decimal values from 0 to 15, each of which is used to indicate a bit position. The bit whose number corresponds to each converted value is then turned ON in a result word. If more than one digit is specified, then one bit will be turned ON in each of consecutive words beginning with R. (See examples, below.)

> The following is an example of a one-digit decode operation from digit number 1 of S, i.e., here Di would be 0001.

The first digit and the number of digits to be converted are designated in Di. If more digits are designated than remain in S (counting from the designated

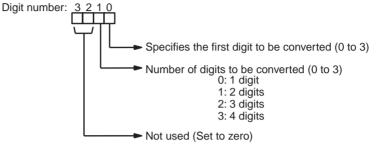

Operand Data Areas

IR, SR, AR, DM, HR, TC, LR,

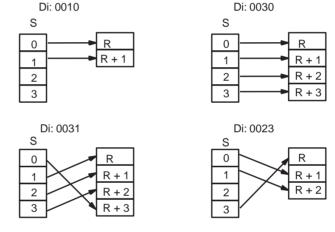

first digit), the remaining digits will be taken starting back at the beginning of S. The final word required to store the converted result (R plus the number of digits to be converted) must be in the same data area as R, e.g., if two digits are converted, the last word address in a data area cannot be designated; if three digits are converted, the last two words in a data area cannot be designated.

Digit Designator

The digits of Di are set as shown below.

Some example Di values and the digit-to-word conversions that they produce are shown below.

Flags

ER:

Undefined digit designator, or R plus number of digits exceeds a data area.

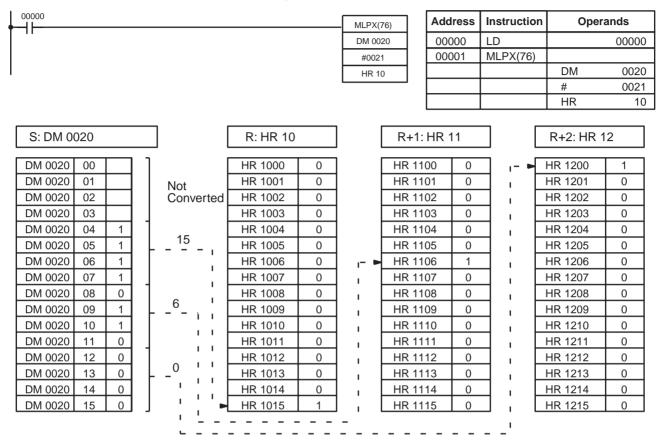

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD or the DM area boundary has been exceeded.)

Conversion Instructions

Section 5-19

Example

The following program converts digits 1 to 3 of data from DM 0020 to bit positions and turns ON the corresponding bits in three consecutive words starting with HR 10. Digit 0 is not converted.

5-19-6 16-TO-4 ENCODER – DMPX(77)

 DMPX(77)	 @DMPX(77)	
SB	SB	
R	R	
Di	Di	

Ladder Symbols

Operand Data Areas

SB: First source word						
IR, SR, AR, DM, HR, TC, LR						
R: Result word						
IR, SR, AR, DM, HR, LR						
Di: Digit designator						
IR, SR, AR, DM, HR, TC, LR, #						

Limitations

The rightmost two digits of Di must each be between 0 and 3.

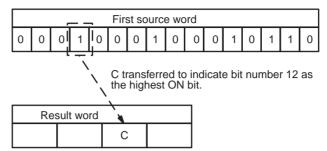

All source words must be in the same data area.

DM 6144 to DM 6655 cannot be used for SB, R, or Di.

Description When the execution condition is OFF, DMPX(77) is not executed. When the execution condition is ON, DMPX(77) determines the position of the highest ON bit in S, encodes it into single-digit hexadecimal value corresponding to the bit number of the highest ON bit number, then transfers the hexadecimal value to the specified digit in R. The digits to receive the results are specified in Di, which also specifies the number of digits to be encoded.

Conversion Instructions

The following is an example of a one-digit encode operation to digit number 1 of R, i.e., here Di would be 0001.

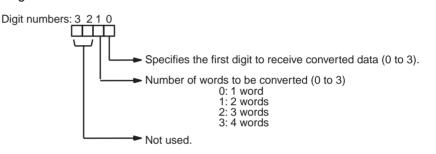

Up to four digits from four consecutive source words starting with S may be encoded and the digits written to R in order from the designated first digit. If more digits are designated than remain in R (counting from the designated first digit), the remaining digits will be placed at digits starting back at the beginning of R.

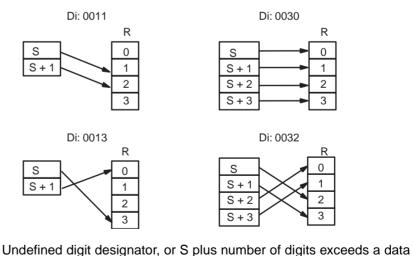

The final word to be converted (S plus the number of digits to be converted) must be in the same data area as SB.

Digit Designator

The digits of Di are set as shown below.

Some example Di values and the word-to-digit conversions that they produce are shown below.

Flags

area.

Content of a source word is zero.

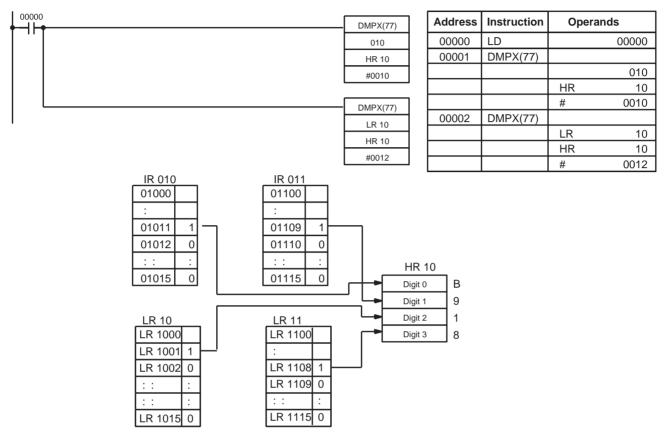

ER:

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

Section 5-19

Example

When 00000 is ON, the following diagram encodes IR words 010 and 011 to the first two digits of HR 10 and then encodes LR 10 and 11 to the last two digits of HR 10. Although the status of each source word bit is not shown, it is assumed that the bit with status 1 (ON) shown is the highest bit that is ON in the word.

5-19-7 7-SEGMENT DECODER – SDEC(78)

SDEC(78)

S

Di

D

S: Source word (binary)
IR, SR, AR, DM, HR, TC, LR
Di: Digit designator
IR, SR, AR, DM, HR, TC, LR, #
D: First destination word
IR, SR, AR, DM, HR, LR

Limitations	Di must be within the values given below. All destination words must be in the same data area. DM 6144 to DM 6655 cannot be used for D.
Description	When the execution condition is OFF, SDEC(78) is not executed. When the execution condition is ON, SDEC(78) converts the designated digit(s) of S into the equivalent 8-bit, 7-segment display code and places it into the destination word(s) beginning with D.

@SDEC(78)

S

Di

D

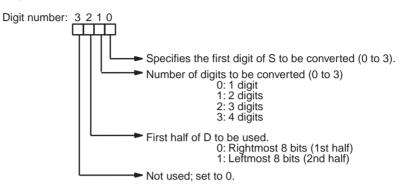

Ladder Symbols

Operand Data Areas

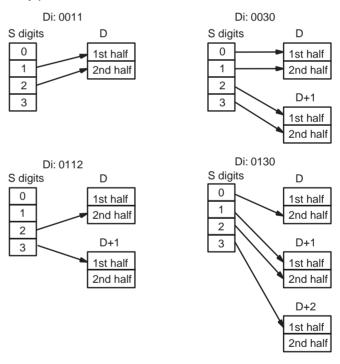

Any or all of the digits in S may be converted in sequence from the designated first digit. The first digit, the number of digits to be converted, and the half of D to receive the first 7-segment display code (rightmost or leftmost 8 bits) are designated in Di. If multiple digits are designated, they will be placed in order starting from the designated half of D, each requiring two digits. If more digits are designated than remain in S (counting from the designated first digit), further digits will be used starting back at the beginning of S.

Digit Designator

The digits of Di are set as shown below.

Some example Di values and the 4-bit binary to 7-segment display conversions that they produce are shown below.

Section 5-19

Example

The following example shows the data to produce an 8. The lower case letters show which bits correspond to which segments of the 7-segment display. The table underneath shows the original data and converted code for all hexadecimal digits.

Ladder Symbols

@ASC(86)

Some examples of Di values and the 4-bit binary to 8-bit ASCII conversions that they produce are shown below.

The leftmost bit of each ASCII character (2 digits) can be automatically adjusted for either even or odd parity. If no parity is designated, the leftmost bit will always be zero.

When even parity is designated, the leftmost bit will be adjusted so that the total number of ON bits is even, e.g., when adjusted for even parity, ASCII "31" (00110001) will be "B1" (10110001: parity bit turned ON to create an even number of ON bits); ASCII "36" (00110110) will be "36" (00110110: parity bit turned OFF because the number of ON bits is already even). The status of the parity bit does not affect the meaning of the ASCII code.

When odd parity is designated, the leftmost bit of each ASCII character will be adjusted so that there is an odd number of ON bits.

Flags

5-19-9 ASCII-TO-HEXADECIMAL – HEX(---)

 HEX(—)]	@HEX()	
S		S	
Di		Di	
D		D	

Ladder Symbols

Operand Data Areas

S: First source word
IR, SR, AR, DM, HR, TC, LR, #
Di: Digit designator
IR, SR, AR, DM, HR, TC, LR, #
D: Destination word
IR, SR, AR, DM, HR, LR

Limitations

This instruction is available in the **CQM1/SRM1 only**.

Di must be within the values given below.

All source words must be in the same data area.

Bytes in the source words must contain the ASCII code equivalent of hexadecimal values, i.e., 30 to 39 (0 to 9) or 41 to 46 (A to F).

DM 6144 to DM 6655 cannot be used for D.

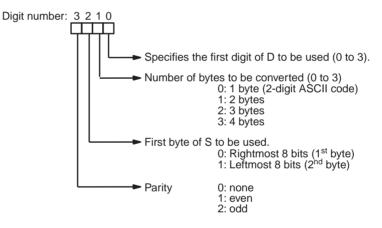

Description When the execution condition is OFF, HEX(—) is not executed. When the execution condition is ON, HEX(—) converts the designated byte(s) of ASCII code from the source word(s) into the hexadecimal equivalent and places it into D.

Up to 4 ASCII codes may be converted beginning with the designated first byte of S. The converted hexadecimal values are then placed in D in order from the designated digit. The first byte (rightmost or leftmost 8 bits), the number of bytes to be converted, and the digit of D to receive the first hexadecimal value are designated in Di. If multiple bytes are designated, they will be converted in order starting from the designated half of S and continuing to S+1 and S+2, if necessary.

If more digits are designated than remain in D (counting from the designated first digit), further digits will be used starting back at the beginning of D. Digits in D that do not receive converted data will not be changed.

Digit Designator

The digits of Di are set as shown below.

42	*	1	0	1	0	0	1	0	В	1	0	1	1
43	*	1	0	1	0	0	1	1	С	1	1	0	0
44	*	1	0	1	0	1	0	0	D	1	1	0	1
45	*	1	0	1	0	1	0	1	E	1	1	1	0
46	*	1	0	1	0	1	1	0	F	1	1	1	1

Parity

Note The leftmost bit of each ASCII code is adjusted for parity.

The leftmost bit of each ASCII character (2 digits) is automatically adjusted for either even or odd parity.

With no parity, the leftmost bit should always be zero. With odd or even parity, the leftmost bit of each ASCII character should be adjusted so that there is an odd or even number of ON bits.

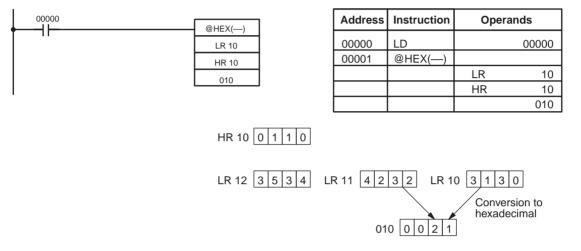

If the parity of the ASCII code in S does not agree with the parity specified in Di, the ER Flag (SR 25503) will be turned ON and the instruction will not be executed.

Flags

ER: Incorrect digit designator, or data area for destination exceeded. Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

Example

In the following example, the 2nd byte of LR 10 and the 1st byte of LR 11 are converted to hexadecimal values and those values are written to the first and second bytes of IR 010.

5-19-10 SCALING - SCL(66)

Ladder Symbols

Operand Data Areas

		S: Source word
SCL(66)	@SCL(66)	IR, SR, AR, DM, HR, TC, LR, #
S	S	
		P1: First parameter word
P1	P1	IR, SR, AR, DM, HR, TC, LR
R	R	R: Result word
		IR, SR, AR, DM, HR, LR

Limitations

This instruction is available in the **CQM1 only**.

P1 through P1+3 must be in the same data area.

DM 6144 to DM 6655 cannot be used for P1 through P1+3 or R.

Description

SCL(66) is used to linearly convert a 4-digit hexadecimal value to a 4-digit BCD value. Unlike BCD(24), which converts a 4-digit hexadecimal value to its 4-digit BCD equivalent (S_{hex} \rightarrow S_{BCD}), SCL(66) can convert the hexadecimal value according to a specified linear relationship. The conversion line is defined by two points specified in the parameter words P1 to P1+3.

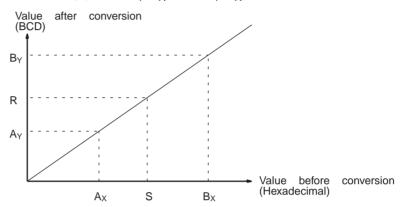

When the execution condition is OFF, SCL(66) is not executed. When the execution condition is ON, SCL(66) converts the 4-digit hexadecimal value in S to the 4-digit BCD value on the line defined by points (P1, P1+1) and (P1+2, P1+3) and places the results in R. The results is rounded off to the nearest

integer. If the results is less than 0000, then 0000 is written to R, and if the result is greater than 9999, then 9999 is written to R.

Parameter	Function	Range	Comments
P1	BCD point #1 (A _Y)	0000 to 9999	
P1+1	Hex. point #1 (A _X)	0000 to FFFF	Do not set P1+1=P1+3.
P1+2	BCD point #2 (B _Y)	0000 to 9999	
P1+3	Hex. point #2 (B _X)	0000 to FFFF	Do not set P1+3=P1+1.

The following table shows the functions and ranges of the parameter words:

The following diagram shows the source word, S, converted to D according to the line defined by points (A_Y, A_X) and (B_Y, B_X) .

The results can be calculated by first converting all values to BCD and then using the following formula.

Results =
$$B_Y - [(B_Y - A_Y)/(B_X - A_X) X (B_X - S)]$$

Flags

Example

ER: The value in P1+1 equals that in P1+3.

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

P1 and P1+3 are not in the same data area, or other setting error.

EQ: ON when the result, R, is 0000.

When 00000 is turned ON in the following example, the BCD source data in DM 0100 (#0100) is converted to hexadecimal according to the parameters in DM 0150 to DM 0153. The result (#0512) is then written to DM 0200.

00000	@SCL(66)		Address	Instruction	Opera	nds
	DM 0100		00000	LD		00000
	DM 0150		00001	@SCL(66)

					DM	0200
	DM DM	01500010015100050152005001530019			0100 0100 0100 0200 0512	_

5-19-11 SIGNED BINARY TO BCD SCALING - SCL2(----)

Ladder Symbols

SCL2()	 @SCL2()
S	S
P1	P1
R	R

Operand Data Areas

S: Source word
IR, SR, AR, DM, HR, LR
P1: First parameter word
IR, SR, AR, DM, HR, LR
R: Result word
IR, SR, AR, DM, HR, LR

Limitations

This instruction is available in the **CQM1-CPU4-E/-EV1 only**. P1 through P1+2 must be in the same data area.

DM 6144 to DM 6655 cannot be used for R.

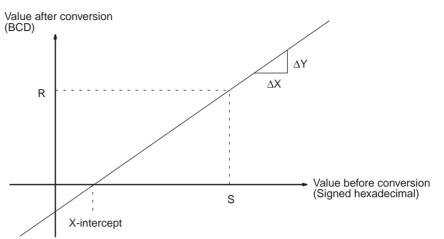

When the execution condition is OFF, SCL2(—) is not executed. When the execution condition is ON, SCL2(—) converts the 4-digit signed hexadecimal value in S to the 4-digit BCD value on the line defined by the x-intercept (P1, 0) and the slope (P1+2 \div P1+1) and places the results in R. The result is rounded off to the nearest integer.

If the result is negative, then CY is set to 1. If the result is less than -9999, then -9999 is written to R. If the result is greater than 9999, then 9999 is written to R.

The following table shows the functions and ranges of the parameter words:

Parameter	Function	Range
P1	x-intercept (signed hex.)	8000 to 7FFF (-32,768 to 32,767)
P1+1	ΔX (signed hex.)	8000 to 7FFF (-32,768 to 32,767)
P1+2	ΔY (BCD)	0000 to 9999

The following diagram shows the source word, S, converted to R according to the line defined by the point (P1, 0) and slope $\Delta Y / \Delta X$.

The result can be calculated by first converting all signed hexadecimal values to BCD and then using the following formula.

$$\mathsf{R} = \frac{\Delta \mathsf{Y}}{\Delta \mathsf{X}} \times (\mathsf{S}-\mathsf{P1})$$

Flags

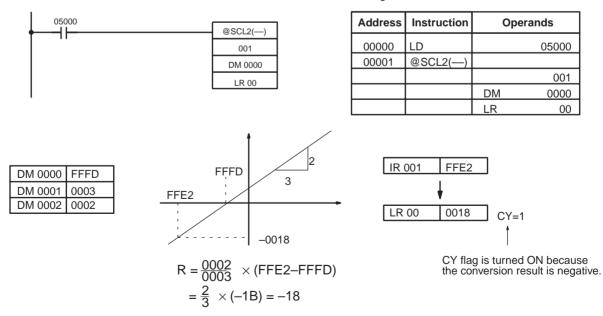

Example

ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

P1 and P1+2 are not in the same data area, or other setting error.

- CY: ON when the result, R, is negative.
- **EQ:** ON when the result, R, is 0000.

When 05000 is turned ON in the following example, the signed binary source data in 001 (#FFE2) is converted to BCD according to the parameters in DM 0000 to DM 0002. The result (#0018) is then written to LR 00 and CY is turned ON because the result is negative.

5-19-12 BCD TO SIGNED BINARY SCALING - SCL3(---)

Ladder Symbols

SCL3()	 @SCL3()
S	S
P1	P1
R	R

Operand Data Areas

S: Source word	
IR, SR, AR, DM, HR, LR	
P1: First parameter word	
IR, SR, AR, DM, HR, LR	
R: Result word	
IR, SR, AR, DM, HR, LR	

Limitations

Description

This instruction is available in the CQM1-CPU4□-E/-EV1 only.
S, P1+1 must be BCD.
P1 through P1+4 must be in the same data area.
DM 6144 to DM 6655 cannot be used for R.
SCL3(—) is used to linearly convert a 4-digit 4-digit BCD value to 4-digit signed hexadecimal. SCL3(—) converts the BCD value according to a specified linear relationship. The conversion line is defined by the y-intercept and the slope of the line specified in the parameter words P1 to P1+2.
When the execution condition is OFF, SCL3(—) is not executed. When the execution condition is ON, SCL3(—) converts the 4-digit BCD value in S to the 4-digit signed hexadecimal value on the line defined by the y-intercept (0, P1) and the slope (P1+2 \div P1+1) and places the result in R. The result is rounded off to the nearest integer.

The content of S can be 0000 to 9999, but S will be treated as a negative value if CY=1, so the effective range of S is actually -9999 to 9999. Be sure to set the desired sign in CY using STC(40) or CLC(41).

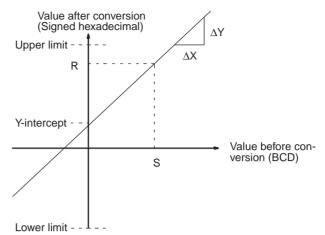

Parameter words P1+3 and P1+4 define upper and lower limits for the result. If the result is greater than the upper limit in P1+3, then the upper limit is written to R. If the result is less than the lower limit in P1+4, then the lower limit is written to R.

Note The upper and lower limits for a 12-bit Analog Input Unit would be 07FF and F800.

The following table shows the functions and ranges of the parameter words:

Parameter	Function	Range
P1	x-intercept (signed hex.)	8000 to 7FFF (-32,768 to 32,767)
P1+1	ΔX (BCD)	0001 to 9999
P1+2	ΔY (signed hex.)	8000 to 7FFF (-32,768 to 32,767)
P1+3	Upper limit (signed hex.)	8000 to 7FFF (-32,768 to 32,767)
P1+4	Lower limit (signed hex.)	8000 to 7FFF (-32,768 to 32,767)

The following diagram shows the source word, S, converted to R according to the line defined by the point (0, P1) and slope $\Delta Y / \Delta X$.

The result can be calculated by first converting all BCD values to signed binary and then using the following formula.

$$\mathsf{R} = \left(\frac{\Delta \mathsf{Y}}{\Delta \mathsf{X}} \times \mathsf{S}\right) + \mathsf{P1}$$

Flags

- ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.) The content of S is not BCD.
- **CY:** CY is not changed by SCL3(—). (CY shows the sign of S before execution.)
- **EQ:** ON when the result, R, is 0000.

Example The status of 00101 determines the sign of the BCD source word in the following example. If 00101 is ON, then the source word is negative. When 00100 is turned ON, the BCD source data in LR 02 is converted to signed binary according to the parameters in DM 0000 to DM 0004. The result is then written to DM 0100. (In the second conversion, the signed binary equivalent of –

Conversion Instructions

Example

When 00000 is OFF (i.e., when the execution condition is ON), the following instruction would convert the seconds given in HR 12 and HR 13 to hours, minutes, and seconds and store the results in DM 0100 and DM 0101 as shown.

5-19-15 COLUMN-TO-LINE – LINE(----)

Ladder Symbols

Operand Data Areas

()	S: First word of 16 word source set
()	IR, SR, AR, DM, HR, TC, LR
	C: Column bit designator (BCD)
	IR, SR, AR, DM, HR, TC, LR, #
	D: Destination word
	IR, SR, AR, DM, HR, TC, LR

Limitations

This instruction is available in the **CQM1 only**.

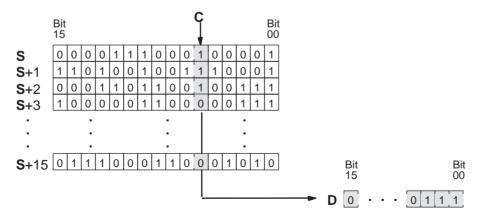

S and S+15 must be in the same data area.

C must be BCD between #0000 and #0015.

DM 6144 to DM 6655 cannot be used for D.

Description

When the execution condition is OFF, LINE(—) is not executed. When the execution condition is ON, LINE(—) copies bit column C from the 16-word set (S to S+15) to the 16 bits of word D (00 to 15).

Flags

ER: The column bit designator C is not BCD, or it is specifying a non-existent bit (i.e., bit specification must be between 00 and 15).

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

S and S+15 are not in the same data area.

EQ: ON when the content of D is zero; otherwise OFF.

Example

The following example shows how to use LINE(—) to move bit column 07 from the set (IR 100 to IR 115) to DM 0100.

Address	Instruction	Оре	ands

_		_	1 [R: Result word
R		R		IR, SR, AR, DM, HR, LR
000		000		
000			J	000
				Not used. Set to 000.

Limitations This instruction is available in the CQM1-CPU4□-E/-EV1 only. DM 6144 to DM 6655 cannot be used for R. Description Converts the four-digit hexadecimal content of the source word (S) to its 2's complement and outputs the result to the result word (R). This operation is effectively the same as subtracting S from 0000 and outputting the result to R; it will calculate the absolute value of negative signed binary data. If the content of S is 0000, the content of R will also be 0000 after execution and EQ (SR 25506) will be turned on. If the content of S is 8000, the content of R will also be 8000 after execution and UF (SR 25405) will be turned on.

Note Refer to 1-10 Calculating with Signed Binary Data for more details.

Flags

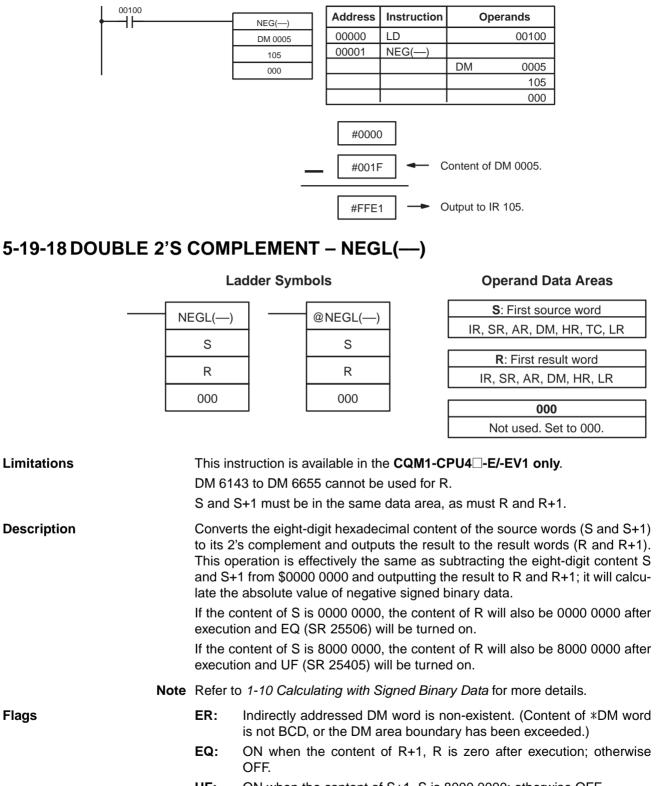

- **ER:** Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)
- EQ: ON when the content of R is zero after execution; otherwise OFF.
- UF: ON when the content of S is 8000; otherwise OFF.

Conversion Instructions

Section 5-19

Example

The following example shows how to use NEG(--) to find the 2's complement of the content of DM 0005 and output the result to IR 105.

UF: ON when the content of S+1, S is 8000 0000; otherwise OFF.

Conversion Instructions

Example

The following example shows how to use NEGL(—) to find the 2's complement of the hexadecimal value in IR 151, IR 150 (001F FFFF) and output the result to HR 04, HR 03.

00000		
	NEGL()	Addre
	150	0000
	LR 03	0000
	000

			-

R+1: LR 0	4 R: LR 03
FFE0	0001

5-20 BCD Calculation Instructions

5-20-1 SET CARRY - STC(40)

Ladder Symbols

When the execution condition is OFF, STC(40) is not executed. When the execution condition is ON, STC(40) turns ON CY (SR 25504).

Note Refer to *Appendix B Error and Arithmetic Flag Operation* for a table listing the instructions that affect CY.

5-20-2 CLEAR CARRY – CLC(41)

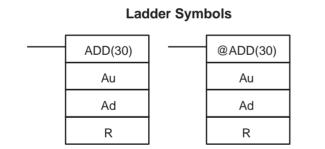

When the execution condition is OFF, CLC(41) is not executed. When the execution condition is ON, CLC(41) turns OFF CY (SR 25504).

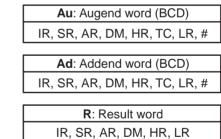

CLEAR CARRY is used to reset (turn OFF) CY (SR 25504) to "0."

Note Refer to *Appendix B Error and Arithmetic Flag Operation* for a table listing the instructions that affect CY.

5-20-3 BCD ADD - ADD(30)

Operand Data Areas

Limitations

Description

DM 6144 to DM 6655 cannot be used for R.

When the execution condition is OFF, ADD(30) is not executed. When the execution condition is ON, ADD(30) adds the contents of Au, Ad, and CY, and places the result in R. CY will be set if the result is greater than 9999.

Flags

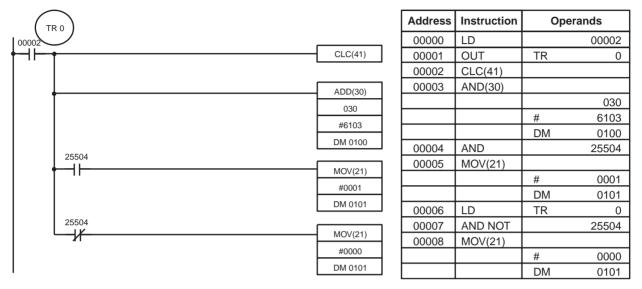

ER: Au and/or Ad is not BCD.

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

- CY: ON when there is a carry in the result.
- **EQ:** ON when the result is 0.

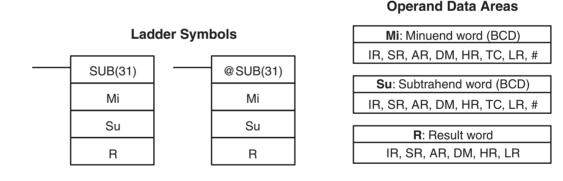

Example

If 00002 is ON, the program represented by the following diagram clears CY with CLC(41), adds the content of IR 030 to a constant (6103), places the result in DM 0100, and then moves either all zeros or 0001 into DM 0101 depending on the status of CY (25504). This ensures that any carry from the last digit is preserved in R+1 so that the entire result can be later handled as eight-digit data.

Although two ADD(30) can be used together to perform eight-digit BCD addition, ADDL(54) is designed specifically for this purpose.

5-20-4 BCD SUBTRACT – SUB(31)

Limitations

Description

DM 6144 to DM 6655 cannot be used for R.

When the execution condition is OFF, SUB(31) is not executed. When the execution condition is ON, SUB(31) subtracts the contents of Su and CY from Mi, and places the result in R. If the result is negative, CY is set and the 10's complement of the actual result is placed in R. To convert the 10's complement to the true result, subtract the content of R from zero (see example below).

Flags

ER: Mi and/or Su is not BCD.

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

- CY: ON when the result is negative, i.e., when Mi is less than Su plus CY.
- EQ: ON when the result is 0.

Example

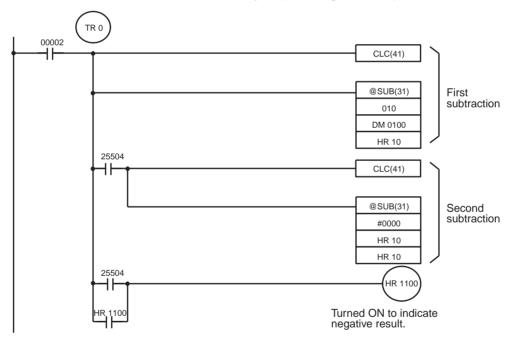

▲ Caution Be sure to clear the carry flag with CLC(41) before executing SUB(31) if its previous status is not required, and check the status of CY after doing a subtraction with SUB(31). If CY is ON as a result of executing SUB(31) (i.e., if the result is negative), the result is output as the 10's complement of the true answer. To convert the output result to the true value, subtract the value in R from 0.

When 00002 is ON, the following ladder program clears CY, subtracts the contents of DM 0100 and CY from the content of 010 and places the result in HR 10.

If CY is set by executing SUB(31), the result in HR 10 is subtracted from zero (note that CLC(41) is again required to obtain an accurate result), the result is placed back in HR 10, and HR 1100 is turned ON to indicate a negative result.

If CY is not set by executing SUB(31), the result is positive, the second subtraction is not performed, and HR 1100 is not turned ON. HR 1100 is programmed as a self-maintaining bit so that a change in the status of CY will not turn it OFF when the program is rescanned.

In this example, differentiated forms of SUB(31) are used so that the subtraction operation is performed only once each time 00002 is turned ON. When another subtraction operation is to be performed, 00002 will need to be turned OFF for at least one cycle (resetting HR 1100) and then turned back ON.

Address	Instruction	Operands		
00000	LD		00002	
00001	OUT	TR	0	
00002	CLC(41)			
00003	@SUB(31)			
			010	
		DM	0100	
		HR	10	
00004	AND		25504	
00005	CLC(41)			
00006	@SUB(31)			
		#	0000	
		HR	10	
		HR	10	
00007	LD	TR	0	
00008	LD		25504	
00009	OR	HR	1100	
00010	AND LD			
00011	OUT	HR	1100	

The first and second subtractions for this diagram are shown below using example data for 010 and DM 0100.

Note The actual SUB(31) operation involves subtracting Su and CY from 10,000 plus Mi. For positive results the leftmost digit is truncated. For negative results the 10s complement is obtained. The procedure for establishing the correct answer is given below.

First S	ubtract	ion	
IR 010	10	29	
DM 010	00 – 3	3452	
CY	— C)	
HR 10	75	77	(1029 + (10000 - 3452))
CY	1		(negative result)
Second	d Subtr	actic	on
	0000		
HR 10	-7577		
CY	-0		
HR 10	2423	(00	00 + (10000 – 7577))
CY 1		`	gative result)

In the above case, the program would turn ON HR 1100 to indicate that the value held in HR 10 is negative.

5-20-5 BCD MULTIPLY – MUL(32)

Ladder Symbols						
	MUL(32)		@MUL(32)			
	Md		Md			
	Mr		Mr			
	R		R			

Operand Data Areas

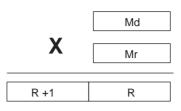

Md: Multiplicand (BCD)
IR, SR, AR, DM, HR, TC, LR, #
Mr: Multiplier (BCD)
IR, SR, AR, DM, HR, TC, LR, #
R: First result word
IR, SR, AR, DM, HR LR

Limitations

DM 6143 to DM 6655 cannot be used for R.

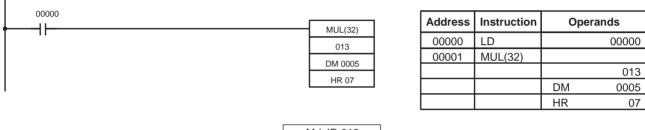

Description

When the execution condition is OFF, MUL(32) is not executed. When the execution condition is ON, MUL(32) multiplies Md by the content of Mr, and places the result In R and R+1.

Example

When IR 00000 is ON with the following program, the contents of IR 013 and DM 0005 are multiplied and the result is placed in HR 07 and HR 08. Example data and calculations are shown below the program.

Md: IR 013					
3	3	5	6		

Mr: DM 000)5
^	0	0	2	5

R+1: HR 08			R: HR 07				
0	0	0	8	3	9	0	0

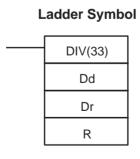

Flags

ER: Md and/or Mr is not BCD.

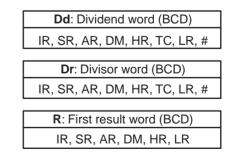

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

- **CY:** ON when there is a carry in the result.
- **EQ:** ON when the result is 0.

5-20-6 BCD DIVIDE – DIV(33)

Operand Data Areas

Limitations

R and R+1 must be in the same data area. DM 6143 to DM 6655 cannot be used for R.

Operands

00000

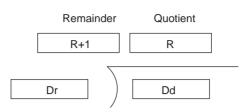

216

09

0017

Description

When the execution condition is OFF, DIV(33) is not executed and the program moves to the next instruction. When the execution condition is ON, Dd is divided by Dr and the result is placed in R and R + 1: the quotient in R and the remainder in R + 1.

Flags

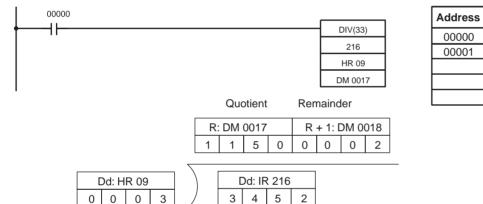

ER: Dd or Dr is not in BCD.

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

EQ: ON when the result is 0.

Example

When IR 00000 is ON with the following program, the content of IR 216 is divided by the content of HR 09 and the result is placed in DM 0017 and DM 0018. Example data and calculations are shown below the program.

5-20-7 DOUBLE BCD ADD – ADDL(54)

Ladder Symbols							
 ADDL(54)		@ADDL(54)					
Au		Au					
Ad		Ad					
R		R					

Operand Data Areas

HR

DM

Instruction

LD

DIV(33)

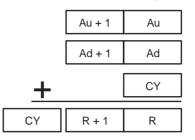

Au: First augend word (BCD)
IR, SR, AR, DM, HR, TC, LR
Ad: First addend word (BCD)
IR, SR, AR, DM, HR, TC, LR
R: First result word
IR, SR, AR, DM, HR, LR

Limitations

DM 6143 to DM 6655 cannot be used for R.

Description

When the execution condition is OFF, ADDL(54) is not executed. When the execution condition is ON, ADDL(54) adds the contents of CY to the 8-digit value in Au and Au+1 to the 8-digit value in Ad and Ad+1, and places the result in R and R+1. CY will be set if the result is greater than 99999999.

Flags

Example

ER: Au and/or Ad is not BCD.

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

CY: ON when there is a carry in the result.

EQ: ON when the result is 0.

When 00000 is ON, the following program section adds two 12-digit numbers, the first contained in LR 00 through LR 02 and the second in DM 0010 through DM 0012. The result is placed in HR 10 through HR 13.

The rightmost 8 digits of the two numbers are added using ADDL(54), i.e., the contents of LR 00 and LR 01 are added to DM 0010 and DM 0011 and the results is placed in HR 10 and HR 11. The second addition adds the leftmost 4 digits of each number using ADD(30), and includes any carry from the first addition. The last instruction, ADB(50) (see 5-21-1 BINARY ADD – ADB(50) adds two all-zero constants to place any carry from the second addition into HR 13.

00000		Address	Instruction	Оре	rands

L	@ADB(50)	00004	@ADB(50)		
	#0000			#	0000
	#0000			#	0000
	HR 13			HR	13

5-20-8 DOUBLE BCD SUBTRACT – SUBL(55)

Ladder Symbols SUBL(55) @SUBL(55) Mi Mi Su Su R R

Operand Data Areas

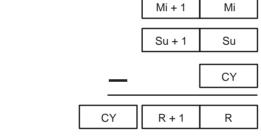

Mi: First minuend word (BCD)
IR, SR, AR, DM, HR, TC, LR, #
Su: First subtrahend word (BCD)
IR, SR, AR, DM, HR, TC, LR, #
R: First result word
IR, SR, AR, DM, HR, LR

Limitations

DM 6143 to DM 6655 cannot be used for R.

Description

When the execution condition is OFF, SUBL(55) is not executed. When the execution condition is ON, SUBL(55) subtracts CY and the 8-digit contents of Su and Su+1 from the 8-digit value in Mi and Mi+1, and places the result in R and R+1. If the result is negative, CY is set and the 10's complement of the actual result is placed in R. To convert the 10's complement to the true result, subtract the content of R from zero. Since an 8-digit constant cannot be directly entered, use the BSET(71) instruction (see 5-17-4 BLOCK SET – BSET(71)) to create an 8-digit constant.

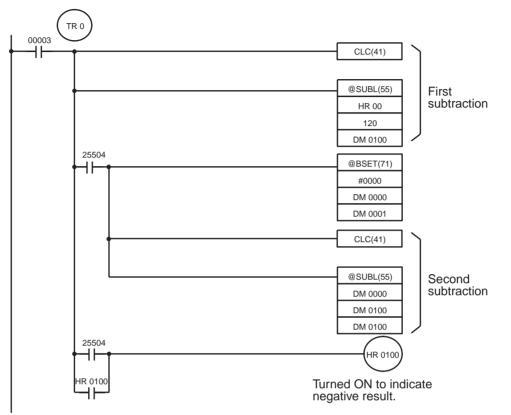

Flags

- ER: Mi, M+1,Su, or Su+1 are not BCD.
 Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)
- **CY:** ON when the result is negative, i.e., when Mi is less than Su.
- **EQ:** ON when the result is 0.

Example

The following example works much like that for single-word subtraction. In this example, however, BSET(71) is required to clear the content of DM 0000 and DM 0001 so that a negative result can be subtracted from 0 (inputting an 8-digit constant is not possible).

5-20-9 DOUBLE BCD MULTIPLY – MULL(56)

Ladder Symbols				
	MULL(56)		@MULL(56)	
	Md		Md	
	Mr		Mr	
	R		R	

Operand Data Areas

Md: First multiplicand word (BCD)
IR, SR, AR, DM, HR, TC, LR
Mr: First multiplier word (BCD)
IR, SR, AR, DM, HR, TC, LR
R: First result word
IR, SR, AR, DM, HR LR

Limitations

DM 6141 to DM 6655 cannot be used for R.

Description

When the execution condition is OFF, MULL(56) is not executed. When the execution condition is ON, MULL(56) multiplies the eight-digit content of Md and Md+1 by the content of Mr and Mr+1, and places the result in R to R+3.

Mr + 1 Mr Х R + 3 R + 2 R + 1 R

Flags

ER: Md, Md+1,Mr, or Mr+1 is not BCD.

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

Md + 1

Md

Operand Data Areas

- CY: ON when there is a carry in the result.
- EQ: ON when the result is 0.

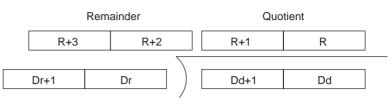

5-20-10 DOUBLE BCD DIVIDE - DIVL(57)

	Ladder Symbols				Dd: First dividend word (BCD)	
		[1		1	IR, SR, AR, DM, HR, TC, LR
		DIVL(57)		@DIVL(57)		Dry First divisor word (PCD)
						Dr: First divisor word (BCD)

		Dr		Dr		
						R: First result word
		R		R		IR, SR, AR, DM, HR LR
imitations		DM 6141	to DM 66	55 cannot be	used for R	

Li

Description

When the execution condition is OFF, DIVL(57) is not executed. When the execution condition is ON, DIVL(57) the eight-digit content of Dd and D+1 is divided by the content of Dr and Dr+1 and the result is placed in R to R+3: the quotient in R and R+1, the remainder in R+2 and R+3.

Flags

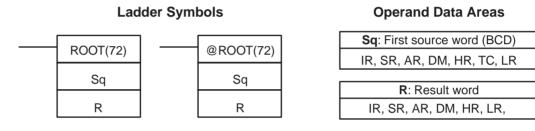

ER: Dr and Dr+1 contain 0.

Dd, Dd+1, Dr, or Dr+1 is not BCD.

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

EQ: ON when the result is 0.

5-20-11 SQUARE ROOT - ROOT(72)

Limitations

This instruction is available in the **CQM1 only**. DM 6144 to DM 6655 cannot be used for R.

Description When the execution condition is OFF, ROOT(72) is not executed. When the execution condition is ON, ROOT(72) computes the square root of the eight-digit content of Sq and Sq+1 and places the result in R. The fractional portion is truncated.

Flags

ER: Sq is not BCD.

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

EQ: ON when the result is 0.

Binary Calculation Instructions

Section 5-21

Example

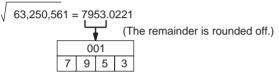

The following example shows how to take the square root of an eight digit number. The result is a four-digit number, with the remainder rounded off. and then round the result.

In this example, $\sqrt{63250561} = 7953.0221...$, which is rounded off to 7953.

00000	
╋──┨┠────	@ROOT(72)
	DM 0000
	001

		DM	0000
			001

5-21 Binary Calculation Instructions

5-21-1 BINARY ADD - ADB(50)

Ladder Symbols				
	1		1	IR, S
ADB(50)		@ADB(50)		
	1			Ad
Au		Au		IR, S
Ad		Ad		
R		R		IR
ĸ	ļ	ĸ		

Operand Data Areas

Au: Augend word (binary)
IR, SR, AR, DM, HR, TC, LR, #
Ad: Addend word (binary)
IR, SR, AR, DM, HR, TC, LR, #
R: Result word
IR, SR, AR, DM, HR, LR

Limitations Description

DM 6144 to DM 6655 cannot be used for R.

When the execution condition is OFF, ADB(50) is not executed. When the execution condition is ON, ADB(50) adds the contents of Au, Ad, and CY, and places the result in R. CY will be set if the result is greater than FFFF.

> Au|+ |Ad| + |CY| → |CY| R

ADB(50) can also be used to add signed binary data. With the CQM1-CPU4D-EV1, CPM1A, and SRM1, the underflow and overflow flags (SR 25404 and SR 25405) indicate whether the result has exceeded the lower or upper limits of the 16-bit signed binary data range.

Flags

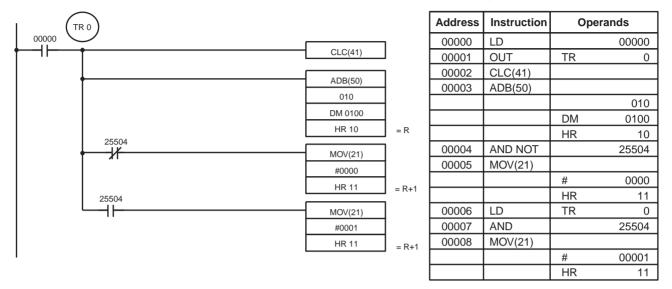

ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

- CY: ON when the result is greater than FFFF.
- EQ: ON when the result is 0.
- OF: ON when the result exceeds +32,767 (7FFF). $(CQM1-CPU4\Box-E/-EV1 only)$

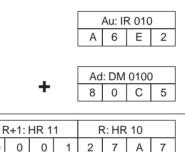

UF: ON when the result is below −32,768 (8000). (CQM1-CPU4□-E/-EV1 only)

Example

The following example shows a four-digit addition with CY used to place either #0000 or #0001 into R+1 to ensure that any carry is preserved.

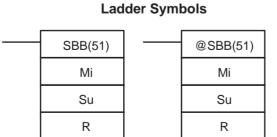

In the case below, A6E2 + 80C5 = 127A7. The result is a 5-digit number, so CY (SR 25504) = 1, and the content of R + 1 becomes #0001.

Note For signed binary calculations, the status of the UF and OF flags indicate whether the result has exceeded the signed binary data range (-32,768 (8000) to +32,767 (7FFF)). (CQM1-CPU4□-EV1 only)

0

5-21-2 BINARY SUBTRACT – SBB(51)

Operand Data Areas

	Mi: Minuend word (binary)
7	IR, SR, AR, DM, HR, TC, LR, #
-	Su: Subtrahend word (binary)
	IR, SR, AR, DM, HR, TC, LR, #
_	R: Result word
	IR, SR, AR, DM, HR, LR

Limitations

Description

DM 6144 to DM 6655 cannot be used for R.

When the execution condition is OFF, SBB(51) is not executed. When the execution condition is ON, SBB(51) subtracts the contents of Su and CY from Mi

and places the result in R. If the result is negative, CY is set and the 2's complement of the actual result is placed in R.

SBB(51) can also be used to subtract signed binary data. With CQM1-CPU4_-EV1, CPM1A, and SRM1, the underflow and overflow flags (SR 25404 and SR 25405) indicate whether the result has exceeded the lower or upper limits of the 16-bit signed binary data range.

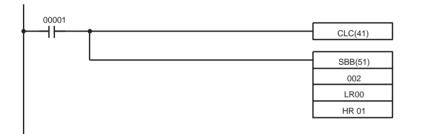

Flags

Example

- **ER:** Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)
- CY: ON when the result is negative, i.e., when Mi is less than Su plus CY.
- **EQ:** ON when the result is 0.
- OF: ON when the result exceeds +32,767 (7FFF). (CQM1-CPU4□-EV1 only)
- UF: ON when the result is below –32,768 (8000). (CQM1-CPU4□-EV1 only)

The following example shows a four-digit subtraction. When IR 00001 is ON, the content of LR 00 and CY are subtracted from the content of IR 002 and the result is written to HR 01.

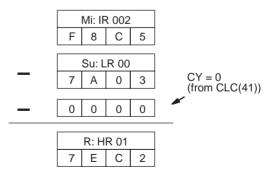

CY is turned ON if the result is negative. If normal data is being used, a negative result (signed binary) must be converted to normal data using NEG(—). Refer to 5-19-172'S COMPLEMENT – NEG(—) for details.

Address	Instruction	Opera	ands
00000	LD		00001
00001	OUT	TR	1
00002	CLC(41)		
00003	SBB(51)		
			002
		LR	00
		HR	01

In the case below, the content of LR 00 (#7A03) and CY are subtracted from IR 002 (#F8C5). Since the result is positive, CY is 0.

If the result had been negative, CY would have been set to 1. For normal (unsigned) data, the result would have to be converted to its 2's complement.

Note For signed binary calculations, the status of the UF and OF flags indicate whether the result has exceeded the signed binary data range (-32,768 (8000) to +32,767 (7FFF)). (CQM1-CPU4□-EV1 only)

5-21-3 BINARY MULTIPLY – MLB(52)

Operand Data Areas

Operand Data Areas

Ladder Symbols Md: Multiplicand word (binary) IR, SR, AR, DM, HR, TC, LR, # MLB(52) @MLB(52) Mr: Multiplier word (binary) Md Md IR, SR, AR, DM, HR, TC, LR, # Mr Mr R: First result word IR, SR, AR, DM, HR LR R R Limitations DM 6143 to DM 6655 cannot be used for R. most four digits in R+1.

5-21-4 BINARY DIVIDE – DVB(53)

Ladder SymbolsDd: Dividend word (binary)DVB(53)@DVB(53)DdDdDdDdDrDrRRRR

Limitations

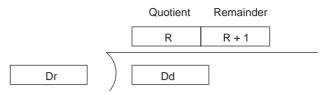

DM 6143 to DM 6655 cannot be used for R.

DVB(53) cannot be used to divide signed binary data. In CQM1 PCs, DBS(—) can be used. Refer to 5-21-9 SIGNED BINARY DIVIDE – DBS(—) for details.

Description When the execution condition is OFF, DVB(53) is not executed. When the execution condition is ON, DVB(53) divides the content of Dd by the content

300

of Dr and the result is placed in R and R+1: the quotient in R, the remainder in R+1.

Flags

ER: Dr contains 0.

> Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

EQ: ON when the result is 0.

5-21-5 DOUBLE BINARY ADD – ADBL(---)

Ladder Symbols		Au: First augend word (binary)			
		1		1	IR, SR, AR, DM, HR, TC, LR, #
	ADBL()		@ADBL()		
				{	Ad: First addend word (binary)
	Au		Au		IR, SR, AR, DM, HR, TC, LR, #
	Ad		Ad		
	7,4		Au	4	R: First result word
	R		R		IR, SR, AR, DM, HR, LR

Limitations

This instruction is available in the **CQM1-CPU4**-**E/-EV1 only**.

Au and Au+1 must be in the same data area, as must Ad and Ad+1, and R and R+1.

DM 6142 to DM 6655 cannot be used for R.

Description When the execution condition is OFF, ADBL(---) is not executed. When the execution condition is ON, ADBL(---) adds the eight-digit contents of Au+1 and Au, the eight-digit contents of Ad+1 and Ad, and CY, and places the result in R. CY will be set if the result is greater than FFFF FFFF.

> CY CY R + 1 R ADBL(---) can also be used to add signed binary data. The underflow and

Au + 1

Ad + 1

Au

Ad

overflow flags (SR 25404 and SR 25405) indicate whether the result has exceeded the lower or upper limits of the 32-bit signed binary data range.

Flags

ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

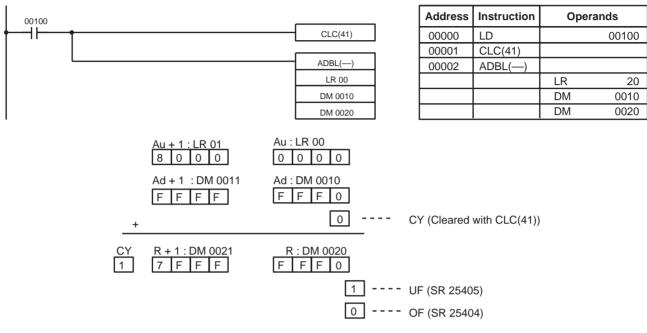

- CY: ON when the result is greater than FFFF FFFF.
- EQ: ON when the result is 0.
- ON when the result exceeds +2,147,483,647 (7FFF FFFF). OF:

Operand Data Areas

Example

UF: ON when the result is below –2,147,483,648 (8000 0000).

The following example shows an eight-digit addition with CY (SR 25504) used to represent the status of the 9th digit. The status of the UF and OF flags indicate whether the result has exceeded the signed binary data range (-2,147,483,648 (8000 0000) to +2,147,483,647 (7FFF FFFF)).

- Note 1. For unsigned binary addition, CY indicates that the sum of the two values exceeds FFFF FFFF. (UF and OF can be ignored.)
 - 2. For signed binary addition, the UF flag indicates that the sum of the two values is below -2,147,483,648 (8000 0000). (CY can be ignored.)

	Ladder S	ymbols	Mi: Minuend word (binary)			
			IR, SR, AR, DM, HR, TC, LR, #			
	SBBL(—) —	@SBB()				
	NC.		Su: Subtrahend word (binary)			
	Mi Mi		IR, SR, AR, DM, HR, TC, LR, #			
	Su	Su				
			R: Result word			
	R	R	IR, SR, AR, DM, HR, LR			
Limitations	This instruction is available in the CQM1-CPU4 -E/-EV1 only . Mi and Mi+1 must be in the same data area, as must Su and Su+1, and R and R+1. DM 6142 to DM 6655 cannot be used for R.					
Description	When the execution condition is OFF, SBBL(—) is not executed. When the execution condition is ON SBBL(—) subtracts CY and the eight-digit value in					

When the execution condition is OFF, SBBL(—) is not executed. When the execution condition is ON, SBBL(—) subtracts CY and the eight-digit value in Su and Su+1 from the eight-digit value in Mi and Mi+1, and places the result in R and R+1. If the result is negative, CY is set and the 2's complement of the

Operand Data Areas

Section 5-21

actual result is placed in R+1 and R. Use NEGL(---) to convert the 2's complement to the true result.

SBBL(—) can also be used to subtract signed binary data. The underflow and overflow flags (SR 25404 and SR 25405) indicate whether the result has exceeded the lower or upper limits of the 32-bit signed binary data range.

Flags

ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

CY: ON when the result is negative, i.e., when Mi is less than Su plus CY.

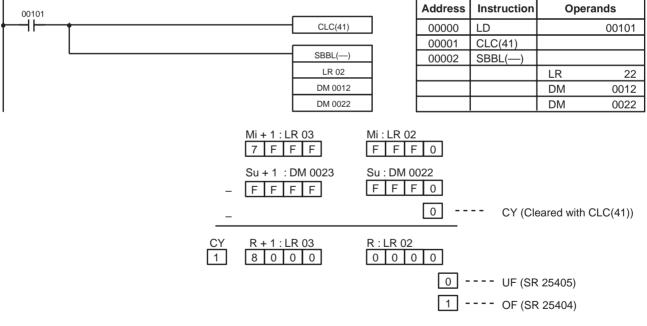

EQ: ON when the result is 0.

OF: ON when the result exceeds +2,147,483,647 (7FFF FFFF).

UF: ON when the result is below –2,147,483,648 (8000 0000).

Example

The following example shows an eight-digit subtraction with CY (SR 25504) used to indicate a negative result (with unsigned data). The status of the UF and OF flags indicate whether the result has exceeded the signed binary data range (-2,147,483,648 (8000 0000) to +2,147,483,647 (7FFF FFFF)).

Note

- For unsigned binary data, CY indicates that the result is negative. Take the 2's complement using NEGL(—) to obtain the absolute value of the true result. (UF and OF can be ignored.)
 - 2. For signed binary data, the OF flag indicates that the result exceeds +2,147,483,647 (7FFF FFFF). (CY can be ignored.)

5-22 Special Math Instructions 5-22-1 FIND MAXIMUM – MAX(—)

Ladder Symbols

	-	
 MAX(—)		@MAX()
С		С
R ₁		R ₁
D		D

Operand Data Areas

C: Control data	
IR, SR, AR, DM, HR, TC, LR, #	
R ₁ : First word in range	
IR, SR, AR, DM, HR, TC, LR	
D: Destination word	
IR, SR, AR, DM, HR, LR	

Limitations This instruction is available in the **CQM1 only**. N must be BCD between 0001 to 9999. R_1 and R_1+N-1 must be in the same data area. DM 6144 to DM 6655 cannot be used for D. Description When the execution condition is OFF, MAX(---) is not executed. When the execution condition is ON, MAX(----) searches the range of memory from R1 to R1+N-1 for the address that contains the maximum value and outputs the maximum value to the destination word (D). If bit 15 of C is ON, MAX(---) identifies the address of the word containing the maximum value in D+1. The address is identified differently for the DM area: 1,2,3... 1. For an address in the DM area, the word address is written to C+1. For example, if the address containing the maximum value is DM 0114, then #0114 is written in D+1. 2. For an address in another data area, the number of addresses from the beginning of the search is written to D+1. For example, if the address containing the maximum value is IR 114 and the first word in the search range is IR 014, then #0100 is written in D+1. If bit 14 of C is ON and more than one address contains the same maximum value, the position of the lowest of the addresses will be output to D+1. The position will be output as the DM address for the DM area, but as an absolute position relative to the first word in the range for all other areas. The number of words within the range (N) is contained in the 3 rightmost digits of C, which must be BCD between 001 and 999. When bit 15 of C is OFF, data within the range is treated as unsigned binary and when it is ON the data is treated as signed binary. **C**: 15 14 12 13 00 11 Number of words in range (N) Not used - set to zero. Output address to D+1? 1 (ON): Yes. Data type 0 (OFF): No. 1 (ON): Signed binary 0 (OFF): Unsigned binary

308

Caution If bit 14 of C is ON, values above #8000 are treated as negative numbers, so the results will differ depending on the specified data type. Be sure that the correct data type is specified.

Flags

ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

 R_1 and R_1+N-1 are not in the same data area.

EQ: ON when the maximum value is #0000.

5-22-2 FIND MINIMUM - MIN(-----)

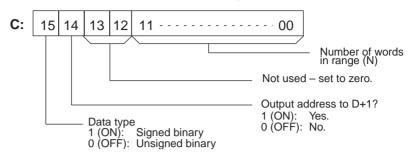

Ladder Symbols

Operand Data Areas

			ress is identified differently for the DM area:			
	1,2,3	1. For an address in the DM area, the word address is written to C+1. For example, if the address containing the minimum value is DM 0114, then #0114 is written in D+1.				
		2. For an address in another data area, the number of addresses from the be- ginning of the search is written to D+1. For example, if the address contain- ing the minimum value is IR 114 and the first word in the search range is IR 014, then #0100 is written in D+1.				
		If bit 14 of C is ON and more than one address contains the same minimum value, the position of the lowest of the addresses will be output to D+1. The position will be output as the DM address for the DM area, but as an absolute position relative to the first word in the range for all other areas.				
		The number of words within the its of C, which must be BCD bet	range (N) is contained in the 3 rightmost dig- ween 001 and 999.			

Section 5-22

When bit 15 of C is OFF, data within the range is treated as unsigned binary and when it is ON the data is treated as signed binary.

Caution If bit 14 of C is ON, values above #8000 are treated as negative numbers, so the results will differ depending on the specified data type. Be sure that the correct data type is specified.

Flags

- **ER:** Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.) R_1 and R_1+N-1 are not in the same data area.
- **EQ:** ON when the minimum value is #0000.

Ladder Symbols

 AVG(—)
S
N
D

Operand Data Areas

S: Source word
IR, SR, AR, DM, HR, TC, LR
N: Number of cycles
IR, SR, AR, DM, HR, TC, LR, #
D: First destination word

IR, SR, AR, DM, HR, LR

Limitations	This instruction is available in the CQM1 only . S must be hexadecimal. N must be BCD from #0001 to #0064. D and D+N+1 must be in the same data area.
	D and D+N+1 must be in the same data area. DM 6144 to DM 6655 cannot be used for S, N, or D to D+N+1.
Description	AVG(—) is used to calculate the average value of S over N cycles. When the execution condition is OFF, AVG(—) is not executed. Each time that AVG(—) is executed, the content of S is stored in words D+2 to D+N+1. On the first execution, AVG(—) writes the content of S to D+2; on the second execution it writes the content of S to D+3, etc. On the N th execution, AVG(—) writes the content of S is stored in D+N+1, AVG(—) calculates the average value of the values stored in D+2 to D+N+1, and writes the average to D.

	D Average value (after N or more executions)
	D+1 Used by the system.
	D+2 Content of S from the 1 st execution of AVG(—)
	D+3 Content of S from the 2 nd execution of AVG(—)
	D+N+1 Content of S from the N th execution of AVG(—)
Precautions	The average value is calculated in binary. Be sure that the content of S is in binary.
	N must be BCD from #0001 to #0064. If the content of N \ge #0065, AVG(—) will operate with N=64.
	The average value will be rounded off to the nearest integer value. (0.5 is rounded up to 1.)
	Leave the contents of D+1 set to #0000 after the first execution of AVG(—).
Flags	ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)
	One or more operands have been set incorrectly.
	D and D+N+1 are not in the same data area.
Example	In the following example, the content of IR 040 is set to #0000 and then incre- mented by 1 each cycle. For the first two cycles, $AVG()$ moves the content of IR 040 to DM 1002 and DM 1003. On the third and later cycles $AVG()$ calculates the average value of the contents of DM 1002 to DM 1004 and

The following diagram shows the function of words D to D+N+1.

calculates the average value of the contents of DM 1002 to DM 1004 and writes that average value to DM 1000.

5-22-4 SUM - SUM(---)

Ladder Symbols

Operand Data Areas

C: Control data			
IR, SR, AR, DM, HR, LR, #			
R ₁ : First word in range			
IR, SR, AR, DM, HR, TC, LR			
D: First destination word			
IR, SR, AR, DM, HR, LR			

Limitations

This instruction is available in the **CQM1 only**.

The 3 rightmost digits of C must be BCD between 001 and 999.

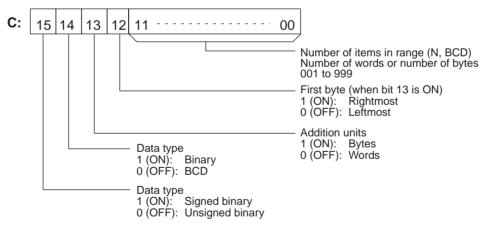

DM 6143 to DM 6655 cannot be used for D.

If bit 14 of C is OFF (setting for BCD data), all data within the range R_1 to R_1 +N–1 must be BCD.

Description

When the execution condition is OFF, SUM(—) is not executed. When the execution condition is ON, SUM(—) adds either the contents of words R_1 to R_1+N-1 or the bytes in words R_1 to $R_1+N/2-1$ and outputs that value to the destination words (D and D+1). The data can be summed as binary or BCD and will be output in the same form. Binary data can be either signed or unsigned.

The function of bits in C are shown in the following diagram and explained in more detail below.

Number of Items in Range

The number of items within the range (N) is contained in the 3 rightmost digits of C, which must be BCD between 001 and 999. This number will indicate the number of words or the number of bytes depending the items being summed.

Addition Units Words will be added if bit 13 is OFF and bytes will be added if bit 13 is ON. If bytes are specified, the range can begin with the leftmost or rightmost byte of R_1 . The leftmost byte of R_1 will not be added if bit 12 is ON. MSB LSB R₁ 1 2 3 R₁+1 4 R₁+2 5 6 7 R1+3 8 I I The bytes will be added in this order when bit 12 is OFF: 1+2+3+4.... The bytes will be added in this order when bit 12 is ON: 2+3+4.... Data Type Data within the range is treated as unsigned binary when bit 14 of C is ON and bit 15 is OFF, and it is treated as signed binary when both bits 14 and 15 are ON. Data within the range is treated as BCD when bit 14 of C is OFF, regardless of the status of bit 15. Flags ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.) R_1 and R_1+N-1 are not in the same data area. The number of items in C is not BCD between 001 and 999. The data being summed in not BCD when BCD was designated. EQ: ON when the result is zero. Example In the following example, the BCD contents of the 8 words from DM 0000 to

DM 0007 are added when IR 00001 is ON and the result is written to DM 0010 and DM 0011.

0 10 ¹ 10 ⁰ 10 ⁻¹						
0	3	0	0			

Enter input data not exceeding #0900 in BCD.

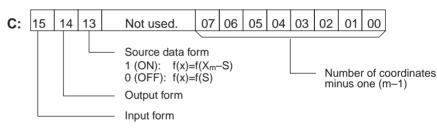

Result data									
D: DM 0110									
10 ⁻¹ 10 ⁻² 10 ⁻³ 10 ⁻⁴									
8 6 6 0									

Result data has four significant digits, fifth and higher digits are ignored. The result for cos(0) will be 0.9999, not 1.

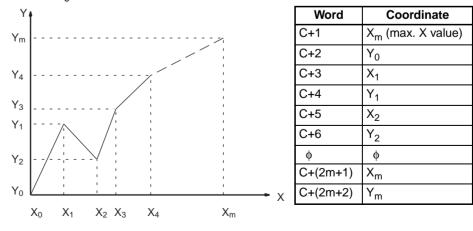

Linear Approximation

APR(—) linear approximation is specified when C is a memory address. Word C is the first word of the continuous block of memory containing the linear approximation data.

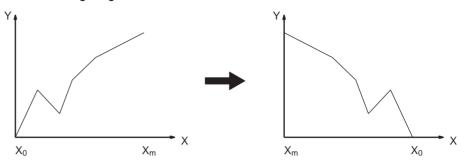

The content of word C specifies the number of line segments in the approximation, and whether the input and output are in BCD or BIN form. Bits 00 to 07 contain the number of line segments less 1, m–1, as binary data. Bits 14 and 15 determine, respectively, the output and input forms: 0 specifies BCD and 1 specifies BIN.

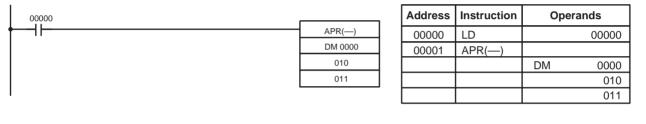

Enter the coordinates of the m+1 end-points, which define the m line segments, as shown in the following table. Enter all coordinates in BIN form. Always enter the coordinates from the lowest X value (X₁) to the highest (X_m). X_0 is 0000, and does not have to be entered.

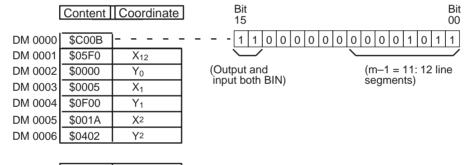

If bit 13 of C is set to 1, the graph will be reflected from left to right, as shown in the following diagram.

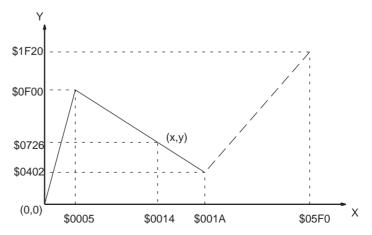

The following example demonstrates the construction of a linear approximation with 12 line segments. The block of data is continuous, as it must be, from DM 0000 to DM 0026 (C to C + $(2 \times 12 + 2)$). The input data is taken from IR 010, and the result is output to IR 011.

DM 0025	\$05F0	X ₁₂
DM 0026	\$1F20	Y ₁₂

In this case, the input data word, IR 010, contains #0014, and f(0014) = #0726 is output to R, IR 011.

00

Increment/Decrement Instructions

Section 5-24

Description

When the execution condition is OFF, XNRW(37) is not executed. When the execution condition is ON, XNRW(37) exclusively NOR's the contents of I1 and I2 bit-by-bit and places the result in R.

Flags

ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

EQ: ON when the result is 0.

5-24 Increment/Decrement Instructions

5-24-1 BCD INCREMENT - INC(38)

	La	adder Symbols	Operand Data Areas				
-	INC(38) Wd	@INC(38) Wd	Wd: Increment word (BCD) IR, SR, AR, DM, HR, LR				
Limitations	DM 614	 44 to DM 6655 cannot be ι	ised for Wd.				
Description		n the execution condition is OFF, INC(38) is not executed. When the exe- on condition is ON, INC(38) increments Wd, without affecting Carry (CY).					
Precautions	of INC	content of Wd will be incremented every cycle if the undifferentiated form IC(38) is used. Use the differentiated form (@INC(38)) or combine 38) with DIFU(13) or DIFD(14) to increment Wd just once.					
Flags	ER:	Wd is not BCD					
		Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)					
	EQ:	ON when the incremented	d result is 0.				

5-24-2 BCD DECREMENT – DEC(39)

Ladder Symbols **Operand Data Areas** Wd: Decrement word (BCD) @DEC(39) **DEC(39)** IR, SR, AR, DM, HR, LR Wd Wd

Limitations

DM 6144 to DM 6655 cannot be used for Wd.

Description

When the execution condition is OFF, DEC(39) is not executed. When the execution condition is ON, DEC(39) decrements Wd, without affecting CY.

	•	9) works the same way as INC(38) except that it decrements the value d of incrementing it.				
Precautions	of DE	The content of Wd will be decremented every cycle if the undifferentiated form of DEC(39) is used. Use the differentiated form (@DEC(39)) or combine $DEC(39)$ with DIFU(13) or DIFD(14) to decrement Wd just once.				
Flags	ER:	Wd is not BCD.				
		Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)				
	EQ:	ON when the decremented result is 0.				

5-25 Subroutine Instructions

Subroutines break large control tasks into smaller ones and enable you to reuse a given set of instructions. When the main program calls a subroutine, control is transferred to the subroutine and the subroutine instructions are executed. The instructions within a subroutine are written in the same way as main program code. When all the subroutine instructions have been executed, control returns to the main program to the point just after the point from which the subroutine was entered (unless otherwise specified in the subroutine).

5-25-1 SUBROUTINE ENTER – SBS(91)

Ladder Symbol

Definer Data Areas

 N: Subroutine number
000 to 255

Limitations

Description

The CQM1-CPU11/21-E supports only subroutine numbers 000 through 127. The CPM1/CPM1A/SRM1 support only subroutine numbers 000 through 049.

A subroutine can be executed by placing SBS(91) in the main program at the point where the subroutine is desired. The subroutine number used in SBS(91) indicates the desired subroutine. When SBS(91) is executed (i.e., when the execution condition for it is ON), the instructions between the SBN(92) with the same subroutine number and the first RET(93) after it are executed before execution returns to the instruction following the SBS(91) that made the call.

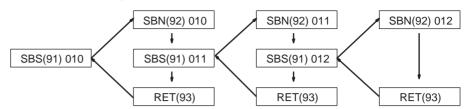

SBS(91) may be used as many times as desired in the program, i.e., the same subroutine may be called from different places in the program).

SBS(91) may also be placed into a subroutine to shift program execution from one subroutine to another, i.e., subroutines may be nested. When the second subroutine has been completed (i.e., RET(93) has been reached), program execution returns to the original subroutine which is then completed before returning to the main program. Nesting is possible to up to sixteen levels. A subroutine cannot call itself (e.g., SBS(91) 000 cannot be programmed within

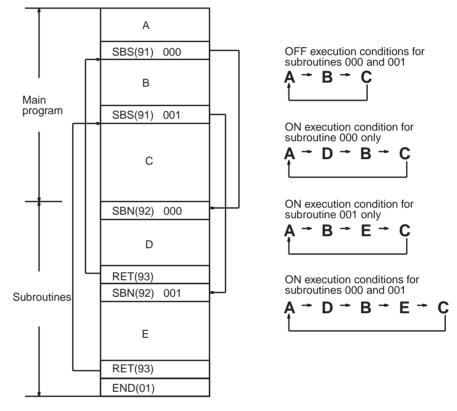

Subroutine Instructions

Section 5-25

the subroutine defined with SBN(92) 000). The following diagram illustrates two levels of nesting.

The following diagram illustrates program execution flow for various execution conditions for two SBS(91).

Flags

ER: A subroutine does not exist for the specified subroutine number.A subroutine has called itself.An active subroutine has been called.

Caution SBS(91) will not be executed and the subroutine will not be called when ER is ON.

5-25-2 SUBROUTINE DEFINE and RETURN – SBN(92)/RET(93)

	Ladder Symbols	Definer Data Areas				
	SBN(92) N	N: Subroutine number				
	ODI ((32) 14	000 to 255				
	RET(93)					
Limitations	The CQM1-CPU11/21-E support only subr The CPM1/CPM1A/SRM1 PCs support on 049. Each subroutine number can be used in SI	ly subroutine numbers 000 through				
Description	SBN(92) is used to mark the beginning of used to mark the end. Each subroutine is in N, that is programmed as a definer for SB ber is used in any SBS(91) that calls the <i>TINE ENTER</i> – <i>SBS(91)</i>). No subroutine n All subroutines must be programmed at the one or more subroutines have been progra executed up to the first SBN(92) before r next cycle. Subroutines will not be executed END(01) must be placed at the end of the the last RET(93). It is not required at any o	dentified with a subroutine number, N(92). This same subroutine num- subroutine (see <i>5-25-1 SUBROU</i> - umber is required with RET(93). The end of the main program. When rammed, the main program will be eturning to address 00000 for the d unless called by SBS(91).				
Precautions	If SBN(92) is mistakenly placed in the main program, it will inhibit program execution past that point, i.e., program execution will return to the beginning when SBN(92) is encountered. If either DIFU(13) or DIFU(14) is placed within a subroutine, the operand bit					
	will not be turned OFF until the next time to operand bit may stay ON longer than one of					
Flags	There are no flags directly affected by thes	e instructions.				

5-26 Special Instructions

5-26-1 TRACE MEMORY SAMPLING – TRSM(45)

Caution This instruction is not supported by CQM1-CPU11-E/21-E, the CPM1/ CPM1A/SRM1 PCs.

Data tracing can be used to facilitate debugging programs. To set up and use data tracing it is necessary to have a host computer running SSS; no data tracing is possible from a Programming Console. Data tracing is described in detail in the SSS Operation Manual: C-series PCs. This section shows the ladder symbol for TRSM(45) and gives an example program.

Ladder Symbol

TRSM(45)

Description

TRSM(45) is used in the program to mark locations where specified data is to be stored in Trace Memory. Up to 12 bits and up to 3 words may be desig-

nated for tracing. (Refer to the SSS Operation Manual: C-series PCs for details.)

TRSM(45) is not controlled by an execution condition, but rather by two bits in the AR area: AR 2515 and AR 2514. AR 2515 is the Sampling Start bit. This bit is turned ON to start the sampling processes for tracing. The Sampling Start bit must not be turned ON from the program, i.e., it must be turned ON only from the peripheral device. AR 2514 is the Trace Start bit. When it is set, the specified data is recorded in Trace Memory. The Trace Start bit can be set either from the program or from the Programming Device. A positive or negative delay can also be set to alter the actual point from which tracing will begin.

Data can be recorded in any of three ways. TRSM(45) can be placed at one or more locations in the program to indicate where the specified data is to be traced. If TRSM(45) is not used, the specified data will be traced when END(01) is executed. The third method involves setting a timer interval from the peripheral devices so that the specified data will be tracing at a regular interval independent of the cycle time. (Refer to the SSS Operation Manual: *C-series PCs.*)

TRSM(45) can be incorporated anywhere in a program, any number of times. The data in the trace memory can then be monitored via a Programming Console, host computer, etc.

AR Control Bits and Flags The following control bits and flags are used during data tracing. The Tracing Flag will be ON during tracing operations. The Trace Completed Flag will turn ON when enough data has been traced to fill Trace Memory.

Flag	Function
AR 2515	Sampling Start Bit*
AR 2514	Trace Start Bit
AR 2513	Tracing Flag
AR 2512	Trace Completed Flag

Note *Do not change the status of AR 2515 from the program.

If TRSM(45) occurs TRSM(45) will not be executed within a JMP(08) - JME(09) block when the jump condition is OFF.

Example

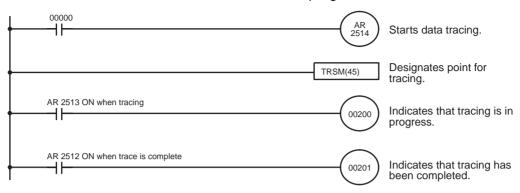

Precautions

The following example shows the basic program and operation for data tracing. Force set the Sampling Start Bit (AR 2515) to begin sampling. The Sampling Start Bit must not be turned ON from the program. The data is read and stored into trace memory.

When IR 00000 is ON, the Trace Start Bit (AR 2514) is also turned ON, and the CPU Unit looks at the delay and marks the trace memory accordingly. This can mean that some of the samples already made will be recorded as the trace memory (negative delay), or that more samples will be made before they are recorded (positive delay).

The sampled data is written to trace memory, jumping to the beginning of the memory area once the end has been reached and continuing up to the start marker. This might mean that previously recorded data (i.e., data from this sample that falls before the start marker) is overwritten (this is especially true

if the delay is positive). The negative delay cannot be such that the required data was executed before sampling was started.

Address	Instruction	Operands

5-26-2 MESSAGE DISPLAY – MSG(46)

Ladder Symbols

Operand Data Areas

 MSG(46)	 @MSG(46)	FM: First message word
. ,	. ,	IR, SR, AR, DM, HR, LR
FM	FM	

Limitations	DM 6649 to DM 6655 cannot be used for FM.
Description	When executed with an ON execution condition, MSG(46) reads eight words of extended ASCII code from FM to FM+7 and displays the message on the Programming Console. The displayed message can be up to 16 characters long, i.e., each ASCII character code requires eight bits (two digits). Refer to <i>Appendix H</i> for the ASCII codes. Japanese katakana characters are included in this code.
	If not all eight words are required for the message, it can be stopped at any point by inputting "OD." When OD is encountered in a message, no more words will be read and the words that normally would be used for the message can be used for other purposes.
Message Buffering and Priority	Up to three messages can be buffered in memory. Once stored in the buffer, they are displayed on a first in, first out basis. Since it is possible that more than three MSG(46)s may be executed within a single cycle, there is a priority scheme, based on the area where the messages are stored, for the selection of those messages to be buffered.
	The priority of the data areas is as follows for message display: LR > IR > HR > AR > TC > DM
	In handling messages from the same area, those with the lowest ad- dress values have higher priority.
	In handling indirectly addressed messages (i.e. *DM), those with the lowest final DM addresses have higher priority.

Special Instructions

ne instruction and data given when 00000 was ON. If 00001 goes ON, a message will be cleared.

5-26-3 I/O REFRESH - IORF(97)

Ladder Symbol

 IORF(97)
St
E

Operand Data Areas

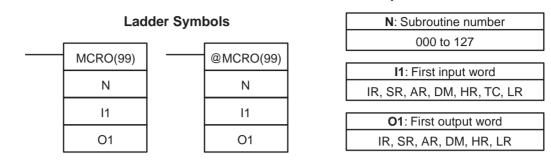

St: Starting word	
IR 000 to IR 115	
E: End word	
IR 000 to IR 115	

	Note	This instruction is not supported by SRM1 PCs.
Limitations		St must be less than or equal to E.
Description		To refresh I/O words, specify the first (St) and last (E) I/O words to be refreshed. When the execution condition for IORF(97) is ON, all words between St and E will be refreshed. This will be in addition to the normal I/O refresh performed during the CPU Unit's cycle.
	Note	This instruction will have no effect on words that are not being used for I/O.
Flags		There are no flags affected by this instruction.

MSG ABCDEFGHIJKLMNOP

-	
Clearing Messages	To clear a message, execute FAL(06) 00 or clear it via a Programming Co sole or the SSS.
	If the message data changes while the message is being displayed, the d play will also change.
Flags	ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)
Example	The following example shows the display that would be produced for t instruction and data given when 00000 was ON. If 00001 goes ON, a me

Operand Data Areas

Limitations

DM 6144 to DM 6655 cannot be used for O1. The CPM1/CPM1A/SRM1 PCs support only subroutine numbers 000 through 049.

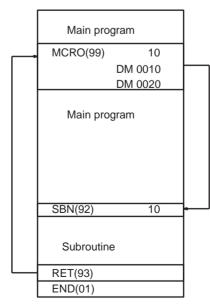

Description The MACRO instruction allows a single subroutine to replace several subroutines that have identical structure but different operands. There are 4 input words, IR 096 to IR 099 (IR 232 to IR 235 in the CPM1/CPM1A/SRM1), and 4 output words, IR 196 to IR 199 (IR 236 to IR 239 in CPM1/CPM1A/SRM1 PCs), allocated to MCRO(99). These 8 words are used in the subroutine and take their contents from I1 to I1+3 and O1 to O1+3 when the subroutine is executed.

When the execution condition is OFF, MCRO(99) is not executed. When the execution condition is ON, MCRO(99) copies the contents of I1 to I1+3 to IR 096 to IR 099, copies the contents of O1 to O1+3 to IR 196 to IR 199, and then calls and executes the subroutine specified in N. When the subroutine is completed, the contents of IR 196 through IR 199 is then transferred back to O1 to O1+3 before MCRO(99) is completed.

Note Refer to page 130 for more details on MCRO(99).

Example

In this example, the contents of DM 0010 through DM 0013 are copied to IR 096 through IR 099, the contents of DM 0020 through DM 0023 are copied to IR 196 through IR 199, and subroutine 10 is called and executed. When the subroutine is completed, the contents of IR 196 to IR 199 are copied back to DM 0020 to DM 0023.

Flags

ER: A subroutine does not exist for the specified subroutine number.

An operand has exceeded a data area boundary.

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

A subroutine has called itself.

An active subroutine has been called.

5-26-5 BIT COUNTER – BCNT(67)

BCNT(67) @BCNT(67) N N SB SB R R

Ladder Symbols

Operand Data Areas

Section 5-26

N: Number of words (BCD)
IR, SR, AR, DM, HR, TC, LR, #
SB: Source beginning word
IR, SR, AR, DM, HR, TC, LR
R: Destination word
IR, SR, AR, DM, HR, TC, LR

Note BCNT(67) is an expansion instruction for the SRM1. The function code 67 is the factory setting and can be changed for the SRM1 if desired.

Limitations	N cannot be 0.

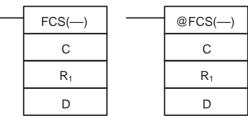

DM 6144 to DM 6655 cannot be used for R.

Description When the execution condition is OFF, BCNT(67) is not executed. When the execution condition is ON, BCNT(67) counts the total number of bits that are ON in all words between SB and SB+(N–1) and places the result in R.

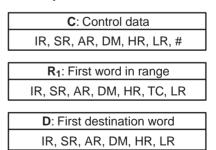

- ER: N is not BCD, or N is 0; SB and SB+(N–1) are not in the same area. The resulting count value exceeds 9999.
 Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)
 - **EQ:** ON when the result is 0.

5-26-6 FRAME CHECKSUM – FCS(-----)

Ladder Symbols

Operand Data Areas

Limitations

Flags

This instruction is available in the **CQM1/SRM1 only**.

The 3 rightmost digits of C must be BCD between 001 and 999.

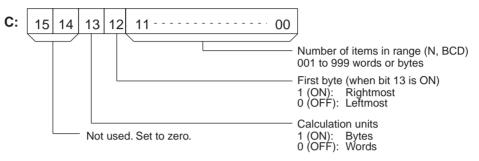

DM 6143 to DM 6655 cannot be used for D.

Description

FCS(—) can be used to check for errors when transferring data through communications ports.

When the execution condition is OFF, FCS(—) is not executed. When the execution condition is ON, FCS(—) calculates the frame checksum of the specified range by exclusively ORing either the contents of words R_1 to R_1+N-1 or the bytes in words R_1 to R_1+N-1 . The frame checksum value (hexadecimal) is then converted to ASCII and output to the destination words (D and D+1).

The function of bits in C are shown in the following diagram and explained in more detail below.

Number of Items in Range

The number of items within the range (N) is contained in the 3 rightmost digits of C, which must be BCD between 001 and 999.

Calculation Units

The frame checksum of words will be calculated if bit 13 is OFF and the frame checksum of bytes will be calculated if bit 13 is ON.

If bytes are specified, the range can begin with the leftmost or rightmost byte of R_1 . The leftmost byte of R_1 will not be included if bit 12 is ON.

	MSB	LSB
R ₁	1	2
R ₁ +1	3	4
R ₁ +2	5	6
R ₁ +3	7	8
I	-	Т
I		Т
I		I

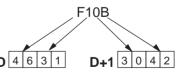

When bit 12 is OFF the bytes will be ORed in this order: 1, 2, 3, 4, When bit 12 is ON the bytes will be ORed in this order: 2, 3, 4, 5,

Conversion to ASCII The byte frame checksum calculation yields a 2-digit hexadecimal value which is converted to its 4-digit ASCII equivalent. The word frame checksum calculation yields a 4-digit hexadecimal value which is converted to its 8-digit ASCII equivalent, as shown below.

Byte frame checksum value

Word frame checksum value

3

Flags

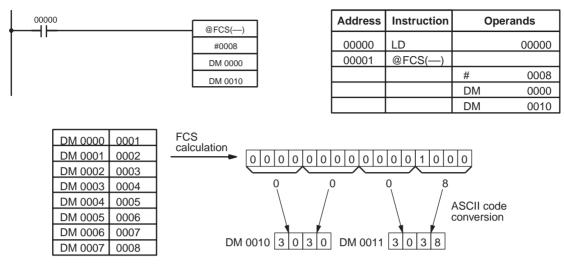

ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.) The number of items is not 001 to 999 BCD.

Special Instructions

Section 5-26

Example

When IR 00000 is ON in the following example, the frame checksum (0008) is calculated for the 8 words from DM 0000 to DM 0007 and the ASCII equivalent (30 30 30 38) is written to DM 0010 and DM 0011.

5-26-7 FAILURE POINT DETECTION - FPD(---)

Ladder Symbols	Operand Data Areas
FPD()	C: Control data #
С	T: Monitoring time (BCD)
Т	IR, SR, AR, DM, HR, TC. LR, #
D	D: First register word
	IR, SR, AR, DM, HR, LR
This instruction is available in the	he CQM1 only.

Limitations

D and D+8 must be in the same data area when bit 15 of C is ON.

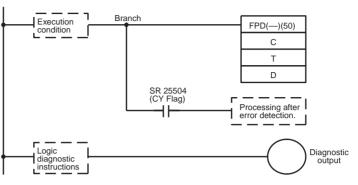

DM 6144 to DM 6655 cannot be used for T or D.

C must be input as a constant.

DescriptionFPD(—) can be used in the program as many times as desired, but each
must use a different D. It is used to monitor the time between the execution of
FPD(—) and the execution of a diagnostic output. If the time exceeds T, an
FAL(06) non-fatal error will be generated with the FAL number specified in C.

The program sections marked by dashed lines in the following diagram can be written according to the needs of the particular program application. The processing programming section triggered by CY is optional and can used any

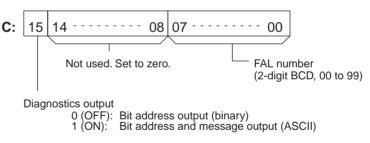

instructions but LD and LD NOT. The logic diagnostic instructions and execution condition can consist of any combination of NC or NO conditions desired.

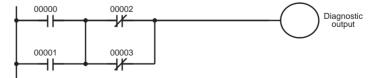

When the execution condition is OFF, FPD(---) is not executed. When the execution condition is ON, FPD(---) monitors the time until the logic diagnostics condition goes ON, turning ON the diagnostic output. If this time exceeds T, the following will occur:

- 1,2,3... An FAL(06) error is generated with the FAL number specified in the first two 1. digits of C. If 00 is specified, however, an error will not be generated.
 - 2. The logic diagnostic instructions are searched for the first OFF input condition and this condition's bit address is output to the destination words beginning at D.
 - 3. The CY Flag (SR 25504) is turned ON. An error processing program section can be executed using the CY Flag if desired.
 - 4. If bit 15 of C is ON, a preset message with up to 8 ASCII characters will be displayed on the Peripheral Device along with the bit address mentioned in step 2.

The function of the control data bits in C are shown in the following diagram.

If the time until the logic diagnostics condition goes ON exceeds T, the logic diagnostic instructions are searched for the OFF input condition. If more than one input condition is OFF, the input condition on the highest instruction line and nearest the left bus bar is selected.

When IR 00000 to IR 00003 are ON, the normally closed condition IR 00002 would be found as the cause of the diagnostic output not turning ON.

There are two ways to output the bit address of the OFF condition detected in the logic diagnostics condition.

1,2,3...

Bit address output (used when bit 15 of C is OFF). 1.

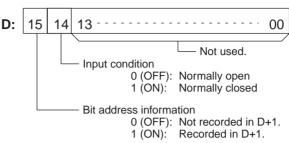

Control Data

Logic Diagnostic

Diagnostics Output

Instructions

Bit 15 of D indicates whether or not bit address information is stored in D+1. If there is, bit 14 of D indicates whether the input condition is normally open or closed.

D+1 contains the bit address code of the input condition, as shown below. The word addresses, bit numbers, and TC numbers are in binary.

Data													
Area	15	14	13	12	11	10 09 08 07 06 05 04				03	02	01	00
IR, SR	1	0	0	0	Wor	Word address			Bit number				
HR	1	0	0	1	1	1 Word address			Bit number				
LR	1	0	0	1	0	0 0 Word address			Bit number				
TC*	1	0	0	1	0	0 1 * Timer or counter number							

Note a) *For the TC area, bit 09 of D+1 indicates whether the number is a timer or counter. A 0 indicates a timer, and a 1 indicates a counter.b) The status of the leftmost bit of the bit number (bit 03) is reversed.

Example: If D + 1 contains 1000 0110 0100 1000, IR 10000 would be indicated as follows:

R \$64 = 100 Bit 00 (inverting status of bit 03)

2. Bit address and message output (selected when bit 15 of C is ON).

Bit 15 of D indicates whether or not there is bit address information stored in D+1 to D+3. If there is, bit 14 of D indicates whether the input condition is normally open or closed. Refer to the following table.

Words D+5 to D+8 contain information in ASCII that are displayed on a Peripheral Device along with the bit address when FPD(-) is executed. Words D+5 to D+8 contain the message preset by the user as shown in the following table.

Word	Bits 15 to 08	Bits 07 to 00
D+1	20 = space	First ASCII character
D+2	Second ASCII character	Third ASCII character
D+3	Fourth ASCII character	Fifth ASCII character
D+4	2D = "–"	"0"=normally open, "1"=normally closed
D+5	First ASCII character	Second ASCII character
D+6	Third ASCII character	Fourth ASCII character
D+7	Fifth ASCII character	Sixth ASCII character
D+8	Seventh ASCII character	Eighth ASCII character

Note If 8 characters are not needed in the message, input "0D" after the last character.

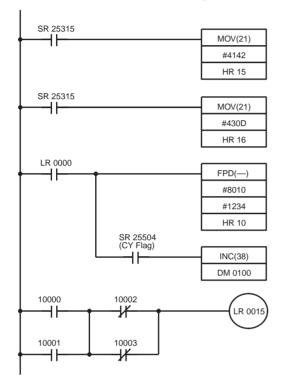

Determining Monitoring Time

The procedure below can be used to automatically set the monitoring time, T, under actual operating conditions when specifying a word operand for T. This operation cannot be used if a constant is set for T.

1,2,3... 1. Switch the CQM1 to MONITOR Mode operation.

- 2. Connect a Peripheral Device, such as a Programming Console.
- 3. Use the Peripheral Device to turn ON control bit AR 2508.
- 4. Execute the program with AR 2508 turned ON. If the monitoring time currently in T is exceeded, 1.5 times the actual monitoring time will be stored in T. FAL(06) errors will not occur while AR 2508 is ON.
- 5. Turn OFF AR 2508 when an acceptable value has been stored in T.

In the following example, the FPD(—) is set to display the bit address and message ("ABC") when a monitoring time of 123.4 s is exceeded.

Address	Instruction	Operands
00000	LD	25315
00001	MOV(21)	
		# 4142
		HR 15
00002	LD	25315
00003	MOV(21)	
		# 430D
		HR 16
00004	LD	LR 0000
00005	FPD(—)	
		# 0010
		# 1234
		HR 10
00006	AND	25504
00007	INC(38)	
		DM 0100
00008	LD	10000
00009	OR	10001
00010	LD NOT	10002
00011	OR NOT	10003
00012	AND LD	
00013	OUT	LR 0015

FPD(—) is executed and begins monitoring when LR 0000 goes ON. If LR 0015 does not turn ON within 123.4 s and IR 10000 through IR 10003 are all ON, IR 10002 will be selected as the cause of the error, an FAL(06) error will be generated with an FAL number of 10, and the bit address and preset message ("10002–1ABC") will be displayed on the Peripheral Device.

			# (000 to 003, 100, or 200)
 INT(89)		@INT(89)	
			000: No function
CC		CC	# (000)
000		000	
		000	D: Control data
D		D	IR, SR, AR, DM, HR, TC, LR, TR, #

Note This instruction is not supported by SRM1 PCs.

Limitations

Description

DM 6644 to DM 6655 cannot be used for D when CC=002.

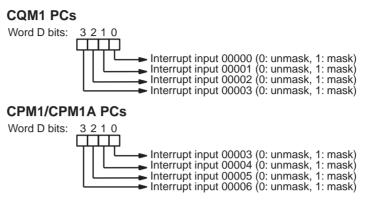

When the execution condition is OFF, INT(89) is not executed. When the execution condition is ON, INT(89) is used to control interrupts and performs one of the six functions shown in the following table depending on the value of CC.

Note Refer to 1-5 CQM1 Interrupt Functions and 1-6 CPM1/CPM1A Interrupt Functions for more details.

INT(89) function	CC
Mask/unmask input interrupts	000
Clear input interrupts	001
Read current mask status	002
Renew counter SV	003
Mask all interrupts	100
Unmask all interrupts	200

These six functions are described in more detail below. Refer to page 22 for more information on these functions.

Mask/Unmask I/O Interrupts (CC=000) This function is used to mask and unmask I/O interrupt inputs 00000 to 00003 (00003 to 00006 in CPM1/CPM1A PCs). Masked inputs are recorded, but ignored. When an input is masked, the interrupt program for it will be run as soon as the bit is unmasked (unless it is cleared beforehand by executing INT(89) with CC=001). Set the corresponding bit in D to 0 or 1 to unmask or mask an I/O interrupt input. Bits 00 to 03 correspond to 00000 to 00003 (00003 to 00006 in CPM1/ CPM1A PCs). Bits 04 to 15 should be set to 0.

Clear I/O Interrupts (CC=001)

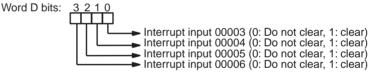

This function is used to clear I/O interrupt inputs 00000 to 00003 (00003 to 00006 in CPM1/CPM1A PCs). Since interrupt inputs are recorded, masked interrupts will be serviced after the mask is removed unless they are cleared first.

Set the corresponding bit in D to 1 to clear an I/O interrupt input. Bits 00 to 03 correspond to 00000 to 00003 (00003 to 00006 in CPM1/CPM1A PCs). Bits 04 to 15 should be set to 0.

CQM1 PCs

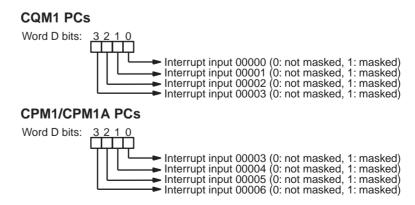

CPM1/CPM1A PCs

Read Current Mask Status (CC=002)

This function is used to write the current mask status for I/O interrupt inputs 00000 to 00003 (00003 to 00006 in CPM1/CPM1A PCs) to word D. The corresponding bit will be ON if the input is masked. (Bits 00 to 03 correspond to 00000 to 00003 in CQM1 PCs, 00003 to 00006 in CPM1/CPM1A PCs.)

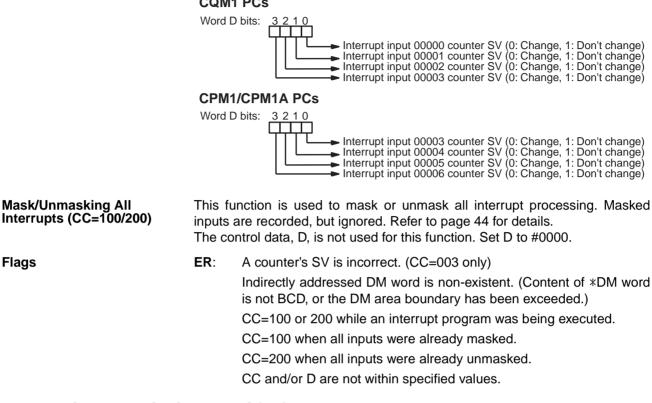

Renew Counter SV (CC=003)

This function is used to renew the counter SV for I/O interrupt inputs 00000 to 00003 (00003 to 00006 in CPM1/CPM1A PCs) to word D. Set the correspond-

ing bit in D to 1 in order to renew the input's counter SV. (Bits 00 to 03 correspond to 00000 to 00003 in CQM1 PCs, 00003 to 00006 in CPM1/CPM1A PCs.)

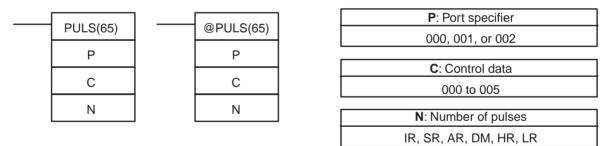

CQM1 PCs

5-26-9 SET PULSES – PULS(65)

Ladder Symbols

Operand Data Areas

Limitations

This instruction is available in the CPM1A with transistor outputs and CQM1 only.

N and N+1 must be in the same data area.

DM 6143 to DM 6655 cannot be used for N.

Description

PULS(65) is used to set parameters for pulse outputs that are started later in the program using SPED(64) or ACC(—). The parameters that can be set are the number of pulses that will be output in independent mode, the direction of pulse outputs from ports 1 and 2, and the deceleration point for pulse outputs controlled by ACC(—) mode 0.

Since PULS(65) has a relatively long execution time, the cycle time can be reduced by executing the differentiated version (@PULS(65)) of this instruction only when it is needed.

Note Refer to 1-3 Pulse Output Function (CQM1 Only) for more details.

Port Specifier (P)

Control Data (C)

The port specifier indicates the pulse output location. The parameters set by the in C and N will apply to the next SPED(64) or ACC(—) instruction in which the same port output location is specified.

Р	Pulse output location
000	Output bit
001	Port 1
002	Port 2

The control data determines the direction of the pulse output to ports 1 and 2 and indicates whether the number of pulses and/or the deceleration point are specified in N to N+3. This operand should be set to 000 when P=000.

С	Direction	Number of pulses	Deceleration point
000	CW	Set in N and N+1	Not set.
001	CCW	Set in N and N+1	Not set.
002	CW	Set in N and N+1	Set in N+2 and N+3
003	CCW	Set in N and N+1	Set in N+2 and N+3
004	CW	Not set.	Not set.
005	CCW	Not set.	Not set.

The direction setting is valid until program execution is stopped or PULS(65) is executed again.

Number of Pulses and
Deceleration PointWhen C=000 to 003, N+1, N contains the 8-digit number of pulses setting for
independent mode pulse outputs. N+1, N can be from 00000001 to
16777215. The pulse output started by SPED(64) or ACC(—) will stop auto-
matically when this number of pulses has been output.

	Leftmost 4 digits	Rightmost 4 digits	Possible range
Number of pulses:	N+1	Ν	0000 0001 to 1677 7215

When C=002 or 003, N+3, N+2 contains the 8-digit number of pulses setting for the deceleration point used in ACC(—) mode 0. N+3, N+2 can be from 00000001 to 16777215. The pulse output started by ACC(—) will begin deceleration when this number of pulses have been output.

high-speed counter instruction is being executed in the main program.

	Leftmost 4 digits Rightmost 4 digits Possible range Deceleration point: N+3 N+2 0000 0001 to 1677 73		
	When C=004 or 005, neither the number of pulses nor the deceleration are set. Set N=000 when C=004 or 005.		
Frequency Changes	The number of pulses set to be output will be used even if SPED(64) to change the pulse frequency during operation.	is used	
	For example, if the number of pulses setting is 2,100 and the frequency is changed from 1 KHz to 100 Hz, pulse output will stop in:		
	12 s if the pulse frequency is changed after 1 s at 1 KHz.		
	3 s if the pulse frequency is changed after 2 s at 1 KHz.		
Flags	ER: There is an error in the instruction settings.		
	If a data area boundary is exceeded.

5-26-10 SPEED OUTPUT- SPED(64)

Ladder Symbols

SPED(64)	 @SPED(64)
Р	Р
М	М
F	F

Operand Data Areas

P: Port specifier			
001, 002, or 010 to 150			
M: Output mode			
000 or 001			
F: Pulse frequency			
IR. SR. AR. DM. HR. LR. #			

Limitations This instruction is available in the CPM1A with transistor outputs and CQM1 only. F must be BCD, #0000 to #5000 when a port is specified, #0000 or #0002 to #0100 when an output bit is specified. DM 6144 to DM 6655 cannot be used for F. Description SPED(64) is used to set, change, or stop pulse output from the specified port or output bit. When the execution condition is OFF, SPED(64) is not executed. When the execution condition is ON, SPED(64) sets the pulse frequency F for the port or output bit specified by P. M determines the output mode. Since SPED(64) has a relatively long execution time, the cycle time can be reduced by executing the differentiated version (@SPED(64)) of this instruction only when it is needed. **Note** Refer to 1-3 Pulse Output Function (CQM1 Only) for more details. Port Specifier (P) The port specifier specifies the port or output bit where the pulses will be output. Ρ **Pulse output location** 001 Port 1 002 Port 2 000 to Output bits IR 10000 to IR 10015. 150 The first two digits of P specify which bit of IR 100 is the output bit and the third digit of P is always set to 0. For example, P=000 specifies IR 10000, P=010 specifies IR 10001, ... and P=150 specifies bit IR 10015. The value of M determines the output mode. A value of 000 indicates inde-**Output Mode (M)** pendent mode and a value of 001 indicates continuous mode. In independent mode, the pulse output will continue until one of the following occurs: 1,2,3... The number of pulses specified by the PULS(65) instruction is reached. (Execute PULS(65) before SPED(64) when specifying independent mode.) 2. The INI(61) instruction is executed with C=003. 3. SPED(64) is executed again with the output frequency, F, set to 000. When outputting pulses in independent mode, specify the number of pulses beforehand by executing PULS(65). When outputting from port 1 or 2, specify the direction (CW or CCW) as well.

In independent mode, the number of pulses that have been output to ports 1 and 2 are contained in IR 236 and 237 (port 1) and IR 238 and IR 239 (port 2).

Leftmost 4 digits Rightmost 4 digits

IR 236

Port 1 pulse output PV: IR 237

Port 2 pulse output PV: IR 239 IR 238

In continuous mode, pulses will be output until the INI(61) instruction is executed with C=003 or SPED(64) is executed again with F=0000. If the direction (CW or CCW) is not specified when outputting from port 1 or 2, the pulses will be CW.

Pulse Frequency (F)The value of F sets the pulse frequency in units of 10 Hz, as shown below.
Setting F to 0000 will stop the pulse output at the specified location.

Output location	Possible values of F	
Port 1 or 2	0000 (stops pulse output) or 0001 to 5000 (10 Hz to 50 kHz)	
Output bits	0000 (stops pulse output) or 0002 to 0100 (20 Hz to 1 kHz)	

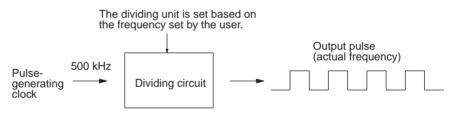

Precaution Regarding Pulse Output

The pulse frequency output from the CQM1-CPU43-EV1 is generated by dividing the 500-kHz basic clock by a dividing unit of an integer value, which results in a difference between the set frequency and actual frequency. Refer to the following equation for calculating an actual frequency.

Set Frequency: Output frequency set in the instruction by the user

Dividing Unit: An integer set in the dividing circuit to generate an output pulse of the set frequency

Actual Frequency: Output pulse frequency actually output from the dividing circuit

Equation:

Actual frequency (KHz) = 500 (KHz)/INT (500 (kHz)/Set frequency (kHz))

INT: Function for obtaining an integer value

INT (500/Set frequency): Dividing unit

The difference between the set frequency and actual frequency becomes larger as the frequency becomes higher.

Example:

Set frequency (kHz)	Actual frequency (kHz)
45.46 to 50.00	50.00
41.67 to 45.45	45.45
38.47 to 41.66	41.67
:	:
31.26 to 33.33	33.33
29.42 to 31.25	31.25
27.78 to 29.41	29.41
:	:
20.01 to 20.83	20.83
19.24 to 20.00	20.00

Set frequency (kHz)	Actual frequency (kHz)		
18.52 to 19.23	19.23		
:	:		
10.01 to 10.20	10.20		
9.81 to 10.00	10.00		
9.62 to 9.80	9.80		
:	:		
5.01 to 5.05	5.05		
4.96 to 5.00	5.00		
4.90 to 4.95	4.95		
:	:		
3.02 to 3.03	3.03		
3.00 to 3.01	3.01		
2.98 to 2.99	2.99		
:	:		

Precautions

With the CQM1-CPU11/21-E, the output refreshing method in DM 6639 (PC Setup) must be set to direct output before initiating pulse output.

The pulse output cannot be used when interval timer 0 is operating.

When a pulse output with a frequency of 500 Hz or higher is output from an output bit, set interrupt processing for the TIMH(15) TC numbers 000 to 003 by setting #0104 in DM 6629 of the PC Setup.

Only one output bit at a time can have a pulse output.

Flags

ER: SPED(64) is executed while interval timer 0 is operating.

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

There is an error in the instruction settings.

SPED(64) is executed in an interrupt subroutine while a pulse I/O or high-speed counter instruction is being executed in the main program.

Operand Data Areas

IR, SR, AR, DM, HR, LR

5-26-11 PULSE OUTPUT - PLS2(----)

PLS2(---) @PLS2(---) P: Communications port P P 001 or 002 D D D: Direction specifier C C C: First control word

Ladder Symbols

Limitations

This instruction is available in the CQM1-CPU43-E/-EV1 only.

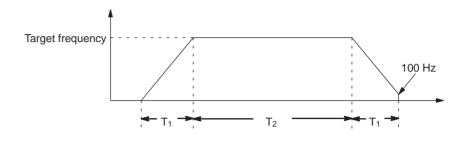

PLS2(----) cannot be used if the PC Setup (DM 6611) is set to high-speed counter mode.

P must be 001 or 002 and D must be 000 or 001.

C to C+3 must be in the same data area.

Description

PLS2(—) is used to output a specified number of CW or CCW pulses from port 1 or 2. The pulse output accelerates to the target frequency at a specified rate and decelerates at the same rate. (Pulse output stops at 100 Hz.)

The following equations show how to calculate the approximate acceleration/ deceleration time T_1 and running time T_2 . Both times are in seconds.

 $T_{1} \cong 0.004 \times \frac{\text{Target frequency}}{\text{Acceration / deceleration rate}}$ $T_{2} \cong \frac{\text{Number of pulses} - (T_{1} \times \text{Target frequency})}{\text{Target frequency}}$

- Although T₁ and T₂ will vary slightly depending on the operating conditions, the number of pulses output will be accurate.
 - PLS2(—) will not operate if pulses are already being output from the specified port. Check the pulse output flags (AR 0515 for port 1 and AR 0615 for port 2) before executing PLS2(—).
 - 3. Refer to 1-3 Pulse Output Function (CQM1 Only) for more details.

P specifies the port where the pulses will be output. Pulses are output from port 1 when P=001, and pulses are output from port 2 when P=002.

D specifies whether the output signal is clockwise (CW) or counter-clockwise (CCW). The output is CW when D=000 and CCW when D=001.

The content of C determines the acceleration/deceleration rate. During acceleration or deceleration, the output frequency is increased or decreased by the amount set in C every 4.08 ms. C must be BCD from 0001 to 0200 (10 Hz to 2 kHz).

The content of C+1 specifies the target frequency. C+1 must be BCD from 0010 to 5000 (100 Hz to 50 kHz).

The 8-digit content of C+3,C+2 determines the number of pulses that will be output. C+3, C+2 must be BCD between 0000 0001 and 1677 7215.

Flags

Operand Settings

ER: There is an error in the operand settings.

The CPU Unit is not a CQM1-CPU43-EV1.

The PC Setup is not set for pulse output.

The target frequency, acceleration/deceleration rate, and number of pulses are incorrect. (Number of pulses $< T_1 \times Target$ frequency)

PLS2(—) is executed in an interrupt subroutine while a pulse I/O or high-speed counter instruction is being executed in the main program.

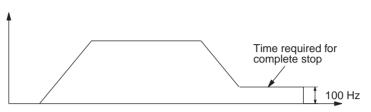

A data area boundary has been exceeded.

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

AR 0515: Port 1 output flag. ON when pulses are being output from port 1.

AR 0615: Port 2 output flag. ON when pulses are being output from port 2.

target speed can cause low-speed pulse output (100 Hz) to continue for an extended period of time when stopping. Even when this happens, the correct number of pulses will be output.

Correct the system by adjusting the acceleration/deceleration speed and/or the target speed, or by using the ACC(---) instruction (mode 0) to increase the speed (deceleration target frequency) when stopping.

5-26-12 ACCELERATION CONTROL – ACC(---)

Operand Data Areas P: Communications port ACC(---) @ACC(---) 001 or 002 Ρ Ρ M: Mode specifier Μ Μ 000 to 003 С С C: First control word IR, SR, AR, DM, HR, LR Limitations This instruction is available in the CQM1-CPU43-E/-EV1 only. Mode 0 of ACC(----) cannot be used if the PC Setup (DM 6611) is set to high-speed counter mode. P must be 001 or 002 and M must be 000 to 003. C to C+3 must be in the same data area. Description ACC(--) is used together with PULS(65) to control the acceleration and/or

deceleration of pulses output from port 1 or 2. The 4 available modes are described briefly below. The function of the control words varies in the 4 modes, but P always specifies the port where the pulses will be output and M always specifies the mode. Set P=001 or 002 to indicate port 1 or 2. Set M=000 to 003 to indicate modes 0 to

Note Refer to 1-3 Pulse Output Function (CQM1 Only) for more details.

Ladder Symbols

3.

Mode 0 (M=000)	Mode 0 is used to output a specified number of CW or CCW pulses from port 1 or 2. The acceleration rate, frequency after acceleration, deceleration point, deceleration rate, and frequency after deceleration can all be controlled.
	Frequency after Deceleration rate
	Acceleration rate
	Deceleration point Output stops.
PULS(65) Operand Settings	PULS(65) must be executed before ACC(—) in order to specify direction, the total number of pulses to be output, and the deceleration point. The function of PULS(65) operands are described below. Refer to <i>5-26-9 SET PULSES – PULS(65)</i> for more details.
1,2,3	1. The first operand of PULS(65) specifies the output port. Pulses are output from port 1 when P=001, and from port 2 when P=002.
	2. The second operand specifies the direction. The output is clockwise (CW) when C=002 and counter-clockwise (CCW) when C=003.
	3. The third operand specifies the first of 4 control words.
	 a) The 8-digit content of N+1,N (0000 0001 to 1677 7215) determines the total number of pulses that will be output.
	 b) The 8-digit content of N+3,N+2 (0000 0001 to 1677 7215) determines the deceleration point.
ACC(—) Control Words	The 4 control words indicate the acceleration rate, frequency after accelera- tion, deceleration rate, and frequency after deceleration.
1,2,3	 The content of C determines the acceleration rate. During acceleration, the output frequency is increased by the amount set in C every 4.08 ms. C must be BCD from 0001 to 0200 (10 Hz to 2 kHz).
	 The content of C+1 specifies the frequency after acceleration. C+1 must be BCD from 0000 to 5000 (0 Hz to 50 kHz).
	3. The content of C+2 determines the deceleration rate. During deceleration, the output frequency is decreased by the amount set in C+2 every 4.08 ms. C must be BCD from 0001 to 0200 (10 Hz to 2 kHz).
	 The content of C+3 specifies the frequency after deceleration. C+3 must be BCD from 0000 to 5000 (0 Hz to 50 kHz).
Mode 1 (M=001)	Mode 1 is used to increase the frequency being output to a target frequency at the specified rate. Pulse output continues until stopped.
	Target frequency
	Frequency before Acceleration rate

Execution of ACC(----)

The 2 control words indicate the acceleration rate and target frequency.

1,2,3... 1. The content of C determines the acceleration rate. During acceleration, the output frequency is increased by the amount set in C every 4.08 ms. C must be BCD from 0001 to 0200 (10 Hz to 2 kHz). 2. The content of C+1 specifies the target frequency. C+1 must be BCD from 0000 to 5000 (0 Hz to 50 kHz). Mode 2 (M=002) Mode 2 is used to decrease the frequency being output to a target frequency at the specified rate. Output stops when the total number of pulses specified in PULS(65) have been output. Frequency before deceleration Deceleration rate Target frequency Output stops. The 2 control words indicate the deceleration rate and target frequency. 1,2,3... 1. The content of C determines the deceleration rate. During deceleration, the output frequency is decreased by the amount set in C every 4.08 ms. C must be BCD from 0001 to 0200 (10 Hz to 2 kHz). 2. The content of C+1 specifies the target frequency. C+1 must be BCD from 0000 to 5000 (0 Hz to 50 kHz). Mode 3 (M=003) Mode 3 is used to decrease the frequency being output to a target frequency at the specified rate. Pulse output continues until stopped. Frequency before deceleration Deceleration rate Target frequency The 2 control words indicate the acceleration rate and target frequency. 1,2,3... 1. The content of C determines the acceleration rate. During acceleration, the output frequency is increased by the amount set in C every 4.08 ms. C must be BCD from 0001 to 0200 (10 Hz to 2 kHz). 2. The content of C+1 specifies the target frequency. C+1 must be BCD from 0000 to 5000 (0 Hz to 50 kHz). Flags ER: There is an error in the operand settings. The CPU Unit is not a CQM1-CPU43-EV1. The PC Setup is not set for pulse output. ACC(---) is executed with M=000 and the specified output port is in use. ACC(---) is executed in an interrupt subroutine while a pulse I/O or high-speed counter instruction is being executed in the main program. Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.) **AR 0515:** Port 1 output flag. ON when pulses are being output from port 1.

AR 0615: Port 2 output flag. ON when pulses are being output from port 2.

5-26-13 PULSE WITH VARIABLE DUTY RATIO – PWM(---)

Ladder Symbols **Operand Data Areas** P: Communications port PWM(----) @PWM(---001 or 002 Ρ Ρ F: Frequency F F 000, 001, or 002 D D D: Duty ratio IR, SR, AR, DM, HR, TC, LR, # Limitations This instruction is available in the CQM1-CPU43-E/-EV1 only.

PWM(—) cannot be used unless the PC Setup (DM 6643 or DM 6644) is set for variable duty ratio pulse outputs.

P must be 001 or 002 and F must be 000, 001, or 002.

D must be BCD between 0001 and 0099.

Description PWM(—) is used to output pulses with the specified duty ratio from port 1 or 2. The output can be set to one of three frequencies: 5.9 kHz, 1.5 kHz, or 91.6 Hz. The pulse output continues until INI(61) is executed to stop it.

> In order for PWM(---) to be executed, the specified port must be set for variable duty ratio pulse outputs in the PC Setup. Set the leftmost digit of DM 6643 to 1 to enable variable duty ratio pulse output from port 1, and set the leftmost digit of DM 6644 to 1 to enable variable duty ratio pulse output from port 2. It is not possible to output normal pulses from a port that is set for variable duty ratio output.

Note Refer to 1-3 Pulse Output Function (CQM1 Only) for more details.

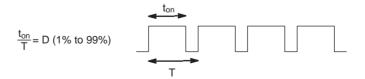

Operand Settings

P specifies the port where the pulses will be output. Pulses are output from port 1 when P=001, and pulses are output from port 2 when P=002.

F specifies the frequency of the pulse output, as shown in the following table.

F	Frequency		
000	5.9 kHz		
001	1.5 kHz		
002	91.6 Hz		

D specifies the duty ratio of the pulse output, i.e., the percentage of time that the output is ON. D must be BCD from 0001 to 0099 (1% to 99%). The duty ratio is 75% in the following diagram.

Flags

ER: There is an error in the operand settings.

The CPU Unit is not a CQM1-CPU43-EV1.

The PC Setup is not set for variable duty ratio pulse output.

PWM(—) is executed in an interrupt subroutine while a pulse I/O or high-speed counter instruction is being executed in the main program.

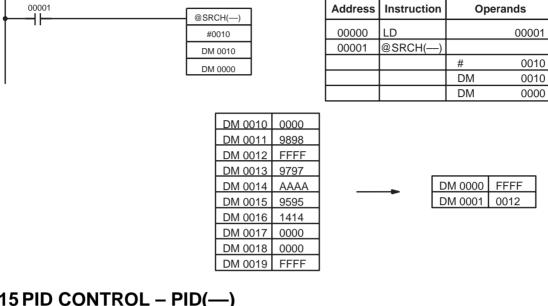

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

Special Instructions

Example

In the following example, the 10 word range from DM 0010 to DM 0019 is searched for addresses that contain the same data as DM 0000 (#FFFF). Since DM 0012 contains the same data, the EQ Flag (SR 25506) is turned ON and #0012 is written to DM 0001.

Ladder Symbol

-[PID()
	IW
	P1
	OW

Operand Data Areas

IW: Input data word
IR, SR, AR, DM, HR, LR
P1: First parameter word
IR, SR, DM, HR, LR
OW: Output data word
IR, SR, AR, DM, HR, LR

Limitations

This instruction is available in the **CQM1-CPU4**-**E/-EV1 only**. DM 6144 to DM 6655 cannot be used for IW, P1 to P1+32, or OW. P1 to P1+32 must be in the same data area.

to operate correctly. Also, PID(---) may not operate dependably in any of the following situations: In interrupt programs, in subroutines, between IL(02) and ILC(03), between JMP(04) and JME(05), and in step programming (STEP(08)/SNXT(09)). Do not program PID(---) in these situations.

Description

PID(---) performs PID control based on the parameters specified in P1 through P1+6. The data in IW is used to calculate the output data that is written to OW. The following table shows the function of the parameter words.

Word	Bits	Parameter name	Function/Setting range
P1	00 to 15	Set value (SV).	This is the target value for PID control. It can be set to any binary num- ber with the number of bits set by the input range parameter.
P1+1	00 to 15	Proportional band width.	This parameter specifies the proportional band width/input range ratio from 0.1% to 999.9%. It must be BCD from 0001 to 9999.

Section 5-26

Word	Bits	Parameter name	Function/Setting range	
P1+2	00 to 15	Integral time	Sets the integral time/sampling period ratio used in integral control. It must be BCD from 0001 to 8191, or 9999. (9999 disables integral control.)	
P1+3	00 to 15	Derivative time	Sets the derivative time/sampling period ratio used in derivative control. It must be BCD from 0001 to 8191, or 0000.	
P1+4	00 to 15	Sampling period	Sets the interval between samplings of the input data from 0.1 to 102.3 s. It must be BCD from 0001 to 1023.	
P1+5	00 to 03	Operation specifier	Sets reverse or normal operation. Set to 0 to specify reverse operation o 1 to specify normal operation.	
	04 to 15	Input filter coefficient	Determines the strength of the input filter. The lower the coefficient, the weaker the filter.	
			This setting must be BCD from 100 to 199, or 000. A setting of 000 sets the default value (0.65) and a setting of 100 to 199 sets the coefficient from 0.00 to 0.99.	
P1+6	00 to 07	Output range	Determines the number of bits of output data. This setting must be between 00 and 08, which sets the output range between 8 and 16 bits	
	08 to 15	Input range	Determines the number of bits of input data. This setting must be between 00 and 08, which sets the input range between 8 and 16 bits.	
P1+7 to P1+32	00 to 15	Work area	Do not use. (Used by the system.)	

When the execution condition is OFF, PID(—) is not executed and the instruction's data is maintained. While the execution condition is OFF, the desired output data can be written directly to OW for manual control.

When the execution condition first goes from OFF to ON, PID(—) reads the parameters and initializes the work area. There is a built-in function to change the output data continuously at startup because sudden changes in the output data might adversely affect the controlled system.

- Caution Changes made to the parameters will not be effective until the execution condition for PID(—) goes from OFF to ON.
 - **Note** Do not use PID(—) in the following situations; it may not be executed properly. In interrupt programs

In subroutine programs

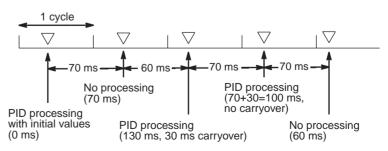

In interlocked program sections (between IL and ILC)

In jump program sections (between JMP and JME)

In step ladder program section (created with STEP)

When the execution condition is ON, PID(—) performs the PID calculation on the input data when the sampling period has elapsed. The sampling period is the time that must pass before input data is read for processing.

The following diagram shows the relationship between the sampling period and PID processing. PID processing is performed only when the sampling period (100 ms in this case) has elapsed.

Flags

ER: There is an error in the parameter settings.

Section 5-27

The cycle time is more than twice as long as the sampling period, so PID(-) cannot be executed accurately. PID(-) will be executed in this case.

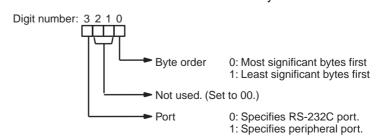

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

CY: ON when PID processing has been performed. (OFF when the sampling period has not elapsed.)

	Note				for details on using the RXD(47) of in the PC Setup, etc.
	⚠ Caution	have been recei soon as possible	ved if received d	ata is not i otion Comp	eceiving more data once 256 bytes read using RXD(47). Read data as bleted Flag is turned ON (AR 0806 bheral port.)
Control Word			control word det which data will b		e port from which data will be read o memory.

Section 5-27

The order in which data is written to memory depends on the value of digit 0 of C. Eight bytes of data 12345678... will be written in the following manner:

Digit $0 = 1$				
	MS	B LSB		
D	2	1		
D+1	4	3		
D+2	6	5		
D+3	8	7		
I	Т	1		
1	1			
1	1	- L -		

D: 11 0 4

Flags

ER: The CPU Unit is not equipped with an RS-232C port.

Another device is not connected to the specified port.

There is an error in the communications settings (PC Setup) or the operand settings.

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

The destination words (D to D+(N+2)-1) exceed the data area.

- AR 08: AR 0806 will be turned ON when data has been received normally at the RS-232C port. Reset when RXD(47) is executed. AR 0814 will be turned ON when data has been received normally at the peripheral port. Reset when RXD(47) is executed.
- AR 09: Contains the number of bytes received at the RS-232C port. Reset to 0000 when RXD(47) is executed.
- **AR 10:** Contains the number of bytes received at the peripheral port. Reset to 0000 when RXD(47) is executed.
- **Note** Communications flags and counters can be cleared either by specifying 0000 for N or using the Port Reset Bits (SR 25208 for peripheral port and SR 25209 for RS-232C port.)

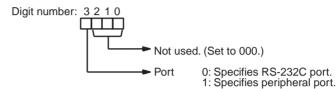

5-27-2 TRANSMIT – TXD(48)

Ladder Symbols			Operand Data Areas	
 TXD(48)		@TXD(48)	ן	S: First source word
17(0)				IR, SR, AR, DM, HR, TC, LR
S		s		
				C: Control word
С		С		#
N		N		
IN			J	N: Number of bytes
				IR, SR, AR, DM, HR, TC, LR, #
This instruction is available in the CQM1/SRM1 only .				

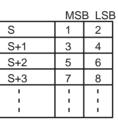

Limitations S and S+(N+2)-1 must be in the same data area. DM 6144 to DM 6655 cannot be used for S or N. N must be BCD from #0000 to #0256. (#0000 to #0061 in host link mode) Description When the execution condition is OFF, TXD(48) is not executed. When the execution condition is ON, TXD(48) reads N bytes of data from words S to S+(N+2)-1, converts it to ASCII, and outputs the data from the specified port. TXD(48) operates differently in host link mode and RS-232C mode, so these modes are described separately.

- Note Flag AR 0805 will be ON when the CQM1 or SRM1 1. is capable of transmitting data through the RS-232C port and AR 0813 will be ON when the CQM1 or SRM1 is capable of transmitting data through the peripheral port.
 - 2. Refer to 1-9 Communications Functions for details on using the TXD(48) instruction, setting communications protocol in the PC Setup, etc.

N must be BCD from #0000 to #0061 (i.e., up to 122 bytes of ASCII). The value of the control word determines the port from which data will be output. as shown below.

The specified number of bytes will be read from S through S+(N/2)-1, converted to ASCII, and transmitted through the specified port. The bytes of source data shown below will be transmitted in this order: 12345678...

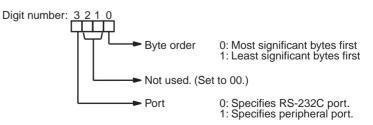

The following diagram shows the format for host link command (TXD) sent from the CQM1. The CQM1 automatically attaches the prefixes and suffixes, such as the node number, header, and FCS.

N must be BCD from #0000 to #00256. The value of the control word determines the port from which data will be output and the order in which data will be written to memory.

The value of the control word determines the port from which data will be read and the order in which data will be written to memory.

Host Link Mode

RS-232C Mode

Control Word

The specified number of bytes will be read from S through S+(NP2)–1 and transmitted through the specified port.

	MSI	B LSB
S	1	2
S+1	3	4
S+2	5	6
S+3	7	8
-	1	1
1	1	1
1	1	· ·

When digit 0 of C is 0, the bytes of source data shown above will be transmitted in this order: 12345678...

When digit 0 of C is 1, the bytes of source data shown above will be transmitted in this order: 21436587...

Note When start and end codes are specified the total data length should be 256 bytes max., including the start and end codes.

Flags

ER: The CPU Unit is not equipped with an RS-232C port.

Another device is not connected to the peripheral port.

There is an error in the communications settings (PC Setup) or the operand settings.

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

The source words (S to S+(N+2)-1) exceed the data area.

AR 08: AR 0805 will be turned ON when it is possible to transmit through the RS-232C port. AR 0813 will be turned ON when it is possible to transmit through the peripheral port.

	Ladder Symbols			Operand Data Areas	
	STUP()]	@STUP(—)		N: RS-232C port specifier
			@0101()		000, 001, or 002
	N		N		C: First source word
		1			S: First source word
	S		S		IR, SR, AR, DM, HR, TC, LR, #
Limitations		N must b S and S- (S can b STUP(— switch is	⊦4 must be in t e set to #0000 -) can't be exe ON.	002 to sp he same to change cuted for	becify IR 000, IR 001, or IR 002.

Description When the execution condition is OFF, STUP(—) is not executed. When the execution condition is ON, STUP(—) changes the PC Setup settings for the port specified by N.

N determines which part of the RS-232C Setup is changed.

Ν	Specified Port
IR 000	Built-in RS-232C port (PC Setup: DM 6645 to DM 6649)
IR 001	Communications Board port A (PC Setup: DM 6555 to DM 6559)
IR 002	Communications Board port B (PC Setup: DM 6550 to DM 6554)

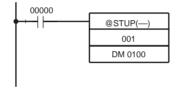

If S is a word address, the contents of S through S+4 are copied to the 5 words in the PC Setup that contain the settings for the port specified by N.

If S is input as the constant #0000, the settings for the specified port are returned to their default values.

S	Function
Word address	The contents of S through S+4 are copied to the part of the PC Setup that contains the settings for the port specified by N.
Constant (#0000)	The settings for the port specified by N are returned to their default values.

Application Example

This example shows a program that transfers the contents of DM 0100 through DM 0104 to the PC Setup area for Communications Board port A (DM 6555 through DM 6569).

Address	Instruction	Ope	rands
00000	LD		00000
00001	@STUP()		
			001
		DM	0100

The settings are transferred as shown below. The Changing RS-232C Setup Flag (SR 27504) will be turned OFF when the transfer has been completed.

The following table shows the function of the transferred setup data.

Word	Content	Function
DM 0100	1001	Enables the communications settings in DM 0101 and sets the communications mode to RS-232C.
DM 0101	0803	Sets the following communications settings: 9,600 bps, 1 start bit, 8-bit data, 1 stop bit, no parity
DM 0102	0000	No transmission delay (0 ms)
DM 0103	2000	Enables the end code CR, LF.
DM 0104	0000	

Flags

ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)The port specifier (N) isn't IR 000, IR 001, or IR 002.

Port A has been specified, but pin 2 of the DIP switch is ON.

The PC Setup is write-protected. (Pin 1 of the DIP switch is ON.)

The specified source words exceed the data area.

The instruction was executed from an interrupt program.

5-28 Advanced I/O Instructions

5-28-1 7-SEGMENT DISPLAY OUTPUT – 7SEG(88)

Ladder Symbols

Operand Data Areas

	S: First source word
7SEG(88)	IR, SR, AR, DM, HR, TC, LR
S	
	O: Output word
0	IR, SR, AR, HR, LR,TC, DM
0	
C	C: Control data
	000 to 007

Limitations This instruction is available in the CQM1 only.

Do not use 7SEG(88) more than twice in the program.

When the execution condition is OFF, 7SEG(88) is not executed. When the execution condition is ON, 7SEG(88) reads the source data (either 4 or 8digit), converts it to 7-segment display data, and outputs that data to the 7segment display connected to the output indicated by O.

The value of C indicates the number of digits of source data and the logic for the Input and Output Units, as shown in the following table.

Source data	Display's data input logic	Display's latch input logic	С
4 digits (S)	Same as Output Unit	Same as Output Unit	0000
		Different from Output Unit	0001
	Different from Output Unit	Same as Output Unit	0002
		Different from Output Unit	0003
8 digits	Same as Output Unit	Same as Output Unit	0004
(S, Š+1)		Different from Output Unit	0005
	Different from Output Unit	Same as Output Unit	0006
		Different from Output Unit	0007

If there are 8 digits of source data, they are placed in S and S+1, with the most significant digits placed in S+1. If there are 4 digits of source data, they are placed in S.

7SEG(88) displays the 4 or 8-digit data in 12 cycles, and then starts over and continues displaying the data.

Refer to page 127 for more information on 7SEG(88) and its applications.

ER:

S and S+1 are not in the same data area. (When set to display 8-digit data.)

Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)

There is an error in operand settings.

SR 25409: ON while 7SEG(88) is being executed.

Description

5-28-2 DIGITAL SWITCH INPUT – DSW(87)

	Ladder Symbols	Operand Data Areas
		IW: Input word
	DSW(87)	IR, SR, AR, DM, HR, TC, LR
	IW	
	OW	OW: Output word
		IR, SR, AR, DM, HR, TC, LR
	R	R: First result word
		IR, SR, AR, DM, HR, TC, LR
Limitations	This instruction is available i	n the CQM1 only.
	DM 6144 to DM 6655 canno	t be used for R.
Description	 DSW(87) is used to read the value set on a digital switch connected to I/O Units. When the execution condition is OFF, DSW(87) is not executed. When the execution condition is ON, DSW(87) reads the value (either 4 or 8-digit) set on the digital switch from IW and places the result in R. If the value is an 8-digit number, it is placed in R and R+1, with the most significant digits placed in R+1. The number of digits is set in DM 6639 of the PC Setup. DSW(87) reads the 4 or 8-digit data in 12 cycles, and then starts over and continues reading the data. Refer to page 124 for more information on DSW(87) and its applications. 	
Flags		ot allocated to the correct I/O Units.
	-	I DM word is non-existent. (Content of *DM word M area boundary has been exceeded.)
	R and R+1 are not i receive 8-digit data.	n the same data area. (When the CQM1 is set to
	SR 25410: ON while D	SW(87) is being executed.

5-28-3 HEXADECIMAL KEY INPUT – HKY(-----)

Ladder Symbols

Operand Data Areas

HKY(—)	IW: Input word
	IR, SR, AR, DM, HR, TC, LR
IW	
OW	OW: Control signal output word
	IR, SR, AR, DM, HR, TC, LR
	D: First register word
	IR, SR, AR, DM, HR, TC, LR

Limitations

This instruction is available in the CQM1 only.

D and D+2 must be in the same data area.

Do not use HKY(----) more than twice in the program.

DM 6144 to DM 6655 cannot be used for D.

eas
C, LR
C, LR
C, LR

Description		When the execution condition is OFF, HKY(—) is not executed. When the execution condition is ON, HKY(—) inputs data from a hexadecimal keypad connected to the input indicated by IW. The data is input in two ways:
	1,2,3	 An 8-digit shift register is created in D and D+1. When a key is pressed on the hexadecimal keypad, the corresponding hexadecimal digit is shifted into the least significant digit of D. The other digits of D, D+1 are shifted left and the most significant digit of D+1 is lost.
		2. The bits of D+2 and bit 4 of OW indicate key input. When one of the keys on the keypad (0 to F) is being pressed, the corresponding bit in D+2 (00 to 15) and bit 4 of OW are turned ON.
	Note	When one of the keypad keys is being pressed, input from the other keys is disabled.
		HKY(—) inputs each digit in 3 to 12 cycles, and then starts over and continues inputting. Refer to page 122 for more details on HKY(—).
Flags		ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.)
		D and D+2 are not in the same data area.
		OD OF 400 ON while $L \langle \rangle / \langle \rangle$ is heir means the d

SR 25408: ON while HKY(—) is being executed.

	D ₁ : First register word
D ₁	IR, SR, AR, DM, HR, TC, LR
D ₂	D ₂ : Key input word
	IR, SR, AR, DM, HR, TC, LR
This instruction is available in t	he CQM1 only.

LimitationsThis instruction is available in the CQM1 only. D_1 and D_1+1 must be in the same data area.

DM 6143 to DM 6655 cannot be used for D₁.

Description

When the execution condition is OFF, TKY(18) is not executed. When the execution condition is ON, TKY(18) inputs data from a ten-key keypad connected to the input indicated by IW. The data is input in two ways:

- An 8-digit shift register is created in D₁ and D₁+1. When a key is pressed on the ten-key keypad, the corresponding BCD digit is shifted into the least significant digit of D₁. The other digits of D₁, D₁+1 are shifted left and the most significant digit of D₁+1 is lost.
 - 2. The first ten bits of D_2 indicate key input. When one of the keys on the keypad (0 to 9) is being pressed, the corresponding bit of D_2 (00 to 09) is turned ON.
 - **Note** When one of the keypad keys is being pressed, input from the other keys is disabled.

TKY(18) can be used in several locations in the program by changing the input word, IW. Refer to page 120 for more details on TKY(18).

ER: Indirectly addressed DM word is non-existent. (Content of *DM word is not BCD, or the DM area boundary has been exceeded.) D_1 and D_1+1 are not in the same data area.

SECTION 6 Host Link Commands

This section explains the methods and procedures for using host link commands, which can be used for host link communications via the CQM1/CPM1A/SRM1 ports.

6-1	Commu	Communications Procedure					
6-2	Command and Response Formats						
	6-2-1	Commands from the Host Computer	362				
	6-2-2	Commands from the PC (CQM1/SRM1 Only)	365				
	6-2-3	Response End Codes	365				
6-3	Host Li	ink Commands	366				
	6-3-1	IR/SR AREA READ — RR	366				
	6-3-2	LR AREA READ — RL	366				
	6-3-3	HR AREA READ — RH	367				
	6-3-4	PV READ — RC	367				
	6-3-5	TC STATUS READ — RG	368				
	6-3-6	DM AREA READ — RD	368

IC	Undefined command (response only)				All	390	

6-1 Communications Procedure

Host link communications are executed by means an exchange of commands and responses between the host computer and the PC.

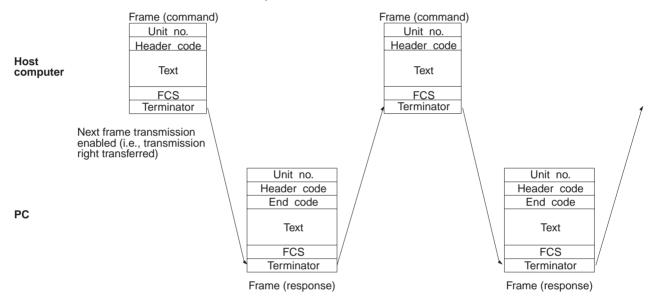

With the CQM1, there are two communications methods that can be used. One is the normal method, in which commands are issued from the host computer to the PC. The other method allows commands to be issued from the PC to the host computer.

Frame Transmission and Reception

Commands and responses are exchanged in the order shown in the illustration below. The block of data transferred in a single transmission is called a "frame." A single frame is configured of a maximum of 131 characters of data.

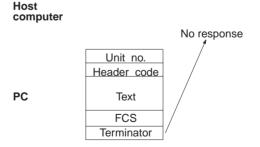

The right to send a frame is called the "transmission right." The Unit that has the transmission right is the one that can send a frame at any given time. The transmission right is traded back and forth between the host computer and the PC each time a frame is transmitted. The transmission right is passed from the transmitting Unit to the receiving Unit when either a terminator (the code that marks the end of a command or response) or a delimiter (the code that sets frames apart) is received.

Commands from Host In host link communications, the host computer ordinarily has the transmission right first and initiates the communications. The PC then automatically sends a response.

Commands from PC (CQM1 Only)

With CQM1 PCs, it is also possible in host link communications for the PC to send commands to the host computer. In this case it is the PC that has the transmission right and initiates the communications.

When commands are issued to the host computer, the data is transmitted in one direction from the PC to the host computer. If a response to a command is required use a host link communications command to write the response from the host computer to the PC.

6-2 Command and Response Formats

This section explains the formats for the commands and responses that are exchanged in host link communications.

6-2-1 Commands from the Host Computer

When a command is issued from the host computer, the command and response formats are as shown below.

Command Format

When transmitting a command from the host computer, prepare the command data in the format shown below.

@

An "@" symbol must be placed at the beginning.

Node No.

Identifies the PC communicating with the host computer. Specify the node number set for the PC in the PC Setup (DM 6648, DM 6653).

Header Code

Set the 2-character command code.

Text

Set the command parameters.

FCS

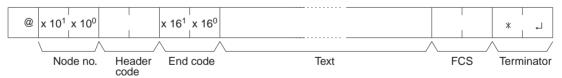

Set a 2-character Frame Check Sequence code. See page 364.

Terminator

Set two characters, "*" and the carriage return (CHR\$(13)) to indicate the end of the command.

Response Format

The response from the PC is returned in the format shown below. Prepare a program so that the response data can be interpreted and processed.

@, Node No., Header Code

Contents identical to those of the command are returned.

End Code

The completion status of the command (e.g., whether or not an error has occurred) is returned.

Text

Text is returned only when there is data such as read data.

FCS, Terminator

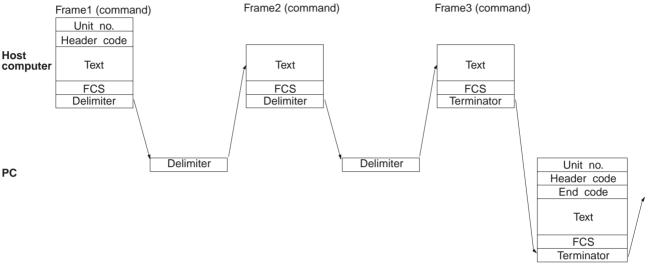

Refer to the corresponding explanations under "Command Format."

Long Transmissions The largest block of data that can be transmitted as a single frame is 131 characters. A command or response of 132 characters or more must therefore be divided into more than one frame before transmission. When a transmis-

sion is split, the ends of the first and intermediate frames are marked by a delimiter instead of a terminator.

Dividing Commands (Host Computer to PC)

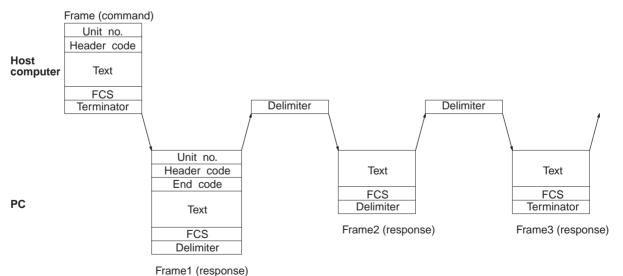

As each frame is transmitted by the host computer, the computer waits for the delimiter to be transmitted from the PC. After the delimiter has been transmitted, the next frame will then be sent. This procedure is repeated until the entire command has been transmitted.

Frame (response)

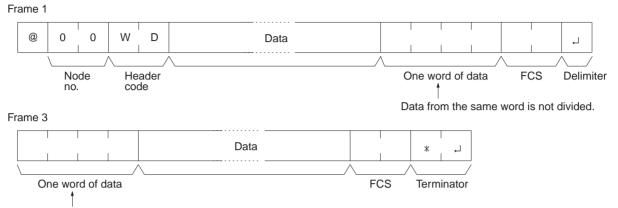

Dividing Responses (PC to Host Computer)

As each frame is received by the host computer, a delimiter is transmitted to the PC. After the delimiter has been transmitted, the PC will transmit the next frame. This procedure is repeated until the entire response has been transmitted.

Precautions for Long Transmissions

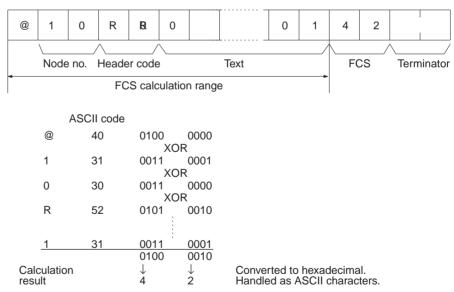

When dividing commands such as WR, WL, WC, or WD that execute write operations, be careful not to divide into separate frames data that is to be written into a single word. As shown in the illustration below, be sure to divide frames so that they coincide with the divisions between words.

Data from the same word is not divided.

FCS (Frame Check Sequence)

When a frame is transmitted, an FCS is placed just before the delimiter or terminator in order to check whether any data error has been generated. The FCS is 8-bit data converted into two ASCII characters. The 8-bit data is the result of an EXCLUSIVE OR performed on the data from the beginning of the frame until the end of the text in that frame (i.e., just before the FCS). Calculating the FCS each time a frame is received and checking the result against the FCS that is included in the frame makes it possible to check for data errors in the frame.

Example Program for FCS	This example shows a BASIC subroutine program for executing an FCS check on a frame received by the host computer.
	<pre>400 *FCSCHECK 410 L=LEN(RESPONSE\$) ' Data transmitted and received 420 Q=0:FCSCK\$=" " 430 A\$=RIGHT\$(RESPONSE\$,1)</pre>
	<pre>440 PRINT RESPONSE\$,A\$,L 450 IF A\$="*" THEN LENGS=LEN(RESPONSE\$)-3 ELSE LENGS=LEN(RESPONSE\$)-2</pre>
	460 FCSP\$=MID\$(RESPONSE\$,LENGS+1,2) ' FCS data received 470 FOR I=1 TO LENGS ' Number of characters in FCS 480 Q=ASC(MID\$(RESPONSE\$,I,1)) XOR Q
	490 NEXT I 500 FCSD\$=HEX\$(Q) 510 IF LEN(FCSD\$)=1 THEN FCSD\$="0"+FCSD\$ ' FCS result
	<pre>520 IF FCSD\$<>FCSP\$ THEN FCSCK\$="ERR" 530 PRINT"FCSD\$=";FCSD\$,"FCSP\$=";FCSP\$,"FCSCK\$=";FCSCK\$ 540 RETURN</pre>
Note	1. Normal reception data includes the FCS, delimiter or terminator, and so

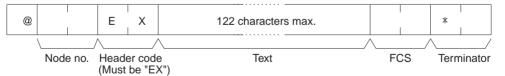

- Normal reception data includes the FCS, delimiter or terminator, and so on. When an error occurs in transmission, however the FCS or some other data may not be included. Be sure to program the system to cover this possibility.
 - 2. In this program example, the CR code (CHR\$(13)) is not entered for RE-SPONSE\$. When including the CR code, make the changes in lines 430 and 450.

6-2-2 Commands from the PC (CQM1/SRM1 Only)

In host link communications, commands are ordinarily sent from the host computer to the PC, but it is also possible for commands to be sent from the PC to the host computer. In Host Link Mode, any data can be transmitted from the PC to the host computer. To send a command to the host computer, use the TRANSMIT instruction (TXD(48)) in the PC program in Host Link Mode.

TXD(48) outputs data from the specified port (the RS-232C port or the peripheral port). Refer to page 350 for details on using TXD(48).

Reception Format When TXD(48) is executed, the data stored in the words beginning with the first send word is converted to ASCII and output to the host computer as a host link command in the format shown below. The "@" symbol, node number, header code, FCS, and delimiter are all added automatically when the transmission is sent. At the host computer, it is necessary to prepare in advance a program for interpreting and processing this format.

One byte of data (2 digits hexadecimal) is converted to two characters in ASCII for transmission, the amount of data in the transmission is twice the amount of words specified for TXD(48). The maximum number of characters for transmission is 122 and the maximum number of bytes that can be designated for TXD(48) is one half of that, or 61.

6-2-3 Response End Codes

Refer to 8-7 Host Link Errors for a table listing the response end codes that may be returned in host link communications. An end code of 00 indicates normal completion of a command.

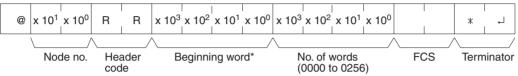

Host Link Commands 6-3

This section explains the commands that can be issued from the host computer to the PC.

6-3-1 IR/SR AREA READ --- RR

Reads the contents of the specified number of IR and SR words, starting from the specified word.

Command Format

Note Beginning word: 0000 to 0255 in CQM1 PCs, 0000 to 0019 and 0200 to 0255 in CPM1/CPM1A/SRM1 PCs.

Response Format

An end code of 00 indicates normal completion.

- Note 1. Words 0020 to 0199 in CPM1/CPM1A/SRM1 PCs cannot be specified. If an attempt to read any of these words is made, a response of 0000 will be returned.
 - 2. The response will be divided when reading more than 30 words of data.

Parameters

Read Data (Response)

The contents of the number of words specified by the command are returned in hexadecimal as a response. The words are returned in order, starting with the specified beginning word.

LR AREA READ --- RL 6-3-2

Node no.

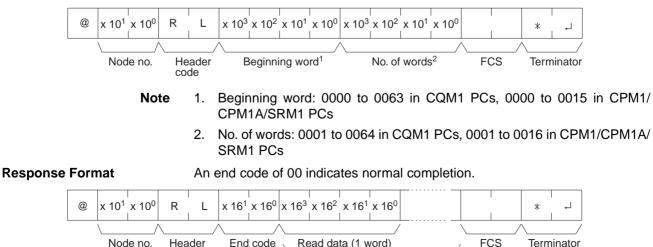

Header

code

End code

Reads the contents of the specified number of LR words, starting from the specified word.

Command Format

Read data (1 word)

Read data (for number of words read)

Terminator

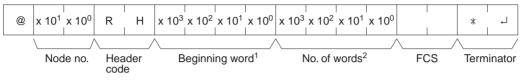

Read Data (Response)

The contents of the number of words specified by the command are returned in hexadecimal as a response. The words are returned in order, starting with the specified beginning word.

6-3-3 HR AREA READ --- RH

Reads the contents of the specified number of HR words, starting from the specified word.

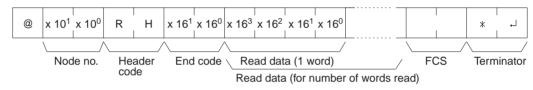

Command Format

- Beginning word: 0000 to 0099 in CQM1 PCs, 0000 to 0019 in CPM1/ Note 1. CPM1A/SRM1 PCs
 - No. of words: 0001 to 0100 in CQM1 PCs, 0001 to 0020 in CPM1/CPM1A/ 2. SRM1 PCs

Response Format

An end code of 00 indicates normal completion.

Parameters

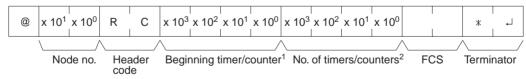

Read Data (Response)

The contents of the number of words specified by the command are returned in hexadecimal as a response. The words are returned in order, starting with the specified beginning word.

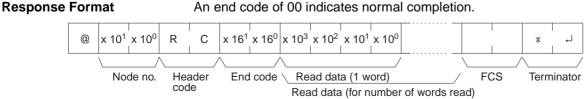

6-3-4 PV READ — RC

Reads the contents of the specified number of timer/counter PVs (present values), starting from the specified timer/counter.

Command Format

- Beginning T/C:0000 to 0511 in CQM1 PCs, 0000 to 0127 in CPM1/ Note 1. CPM1A/SRM1 PCs
 - 2. No. of T/Cs:0001 to 0512 in CQM1 PCs, 0001 to 0128 in CPM1/CPM1A/ SRM1 PCs

An end code of 00 indicates normal completion.

The response will be divided when reading more than 30 words of data.

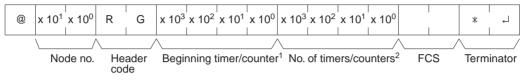

Read Data (Response)

The number of present values specified by the command is returned in hexadecimal as a response. The PVs are returned in order, starting with the specified beginning timer/counter.

6-3-5 TC STATUS READ --- RG

Reads the status of the Completion Flags of the specified number of timers/ counters, starting from the specified timer/counter.

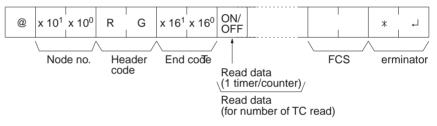

Command Format

- Note 1. Beginning T/C:0000 to 0511 in CQM1 PCs, 0000 to 0127 in CPM1/ CPM1A/SRM1 PCs
 - No. of T/Cs:0001 to 0512 in CQM1 PCs, 0001 to 0128 in CPM1/CPM1A/ SRM1 PCs

Response Format

An end code of 00 indicates normal completion.

The response will be divided when reading the status of more than 123 timer/ counters.

Parameters

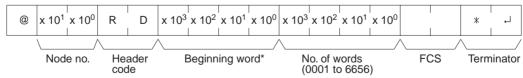

Read Data (Response)

The status of the number of Completion Flags specified by the command is returned as a response. "1" indicates that the Completion Flag is ON.

6-3-6 DM AREA READ --- RD

Reads the contents of the specified number of DM words, starting from the specified word.

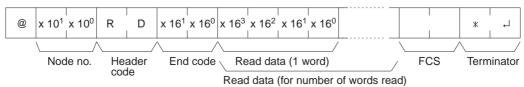

Command Format

Note Beginning word: 0000 to 6655 in CQM1 PCs, 0000 to 1023 and 6144 to 6655 in CPM1/CPM1A PCs, and 0000 to 2047 and 6144 to 6655 in SRM1 PCs.

Response Format

An end code of 00 indicates normal completion.

- Note 1. Words 1024 to 6143 in CPM1/CPM1A PCs and words 2048 to 6143 in SRM1 PCs cannot be specified. If an attempt to read any of these words is made, a response of 0000 will be returned.
 - 2. The response will be divided when reading more than 30 words of data.

Read Data (Response)

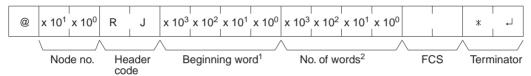

The contents of the number of words specified by the command are returned in hexadecimal as a response. The words are returned in order, starting with the specified beginning word.

Note Be careful about the configuration of the DM area, as it varies depending on the CPU Unit model.

6-3-7 AR AREA READ --- RJ

Reads the contents of the specified number of AR words, starting from the specified word.

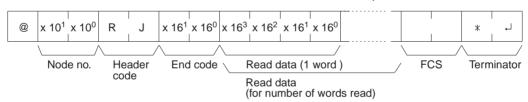

Command Format

- Note 1. Beginning word: 0000 to 0027 in CQM1 PCs, 0000 to 0015 in CPM1/ CPM1A/SRM1 PCs
 - No. of words: 0001 to 0028 in CQM1 PCs, 0001 to 0016 in CPM1/CPM1A/ SRM1 PCs

Response Format

An end code of 00 indicates normal completion.

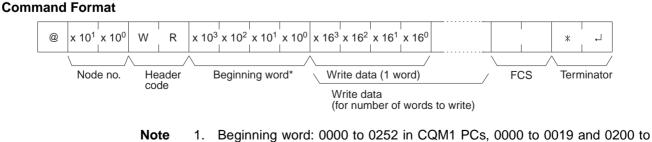

Parameters

Read Data (Response)

The contents of the number of words specified by the command are returned in hexadecimal as a response. The words are returned in order, starting with the specified beginning word.

6-3-8 IR/SR AREA WRITE — WR

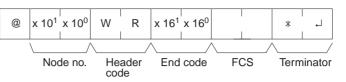

Writes data to the IR and SR areas, starting from the specified word. Writing is done word by word.

- 0252 in CPM1/CPM1A/SRM1 PCs.
 - 2. Divide the command when writing more than 30 words of data.

Response Format

An end code of 00 indicates normal completion.

Note Words 0020 to 0199 in CPM1/CPM1A/SRM1 PCs cannot be specified. If an attempt to write to any of these words is made, the writing operation will not be executed and normal completion occurs.

Parameters

Write Data (Command)

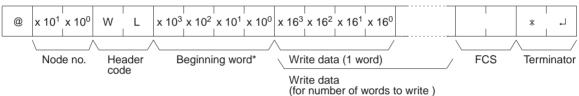

Specify in order the contents of the number of words to be written to the IR or SR area in hexadecimal, starting with the specified beginning word.

Note If data is specified for writing which exceeds the allowable range, an error will be generated and the writing operation will not be executed. If, for example, 252 is specified as the beginning word for writing, and two words of data are specified, then 253 will become the last word for writing data, and the command will not be executed because SR 253 is beyond the writable range.

6-3-9 LR AREA WRITE --- WL

Writes data to the LR area, starting from the specified word. Writing is done word by word.

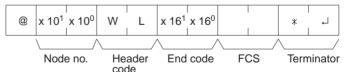

Command Format

Note Beginning word: 0000 to 0063 in CQM1 PCs, 0000 to 0015 in CPM1/CPM1A/ SRM1 PCs

Response Format

An end code of 00 indicates normal completion.

Parameters

Write Data (Command)

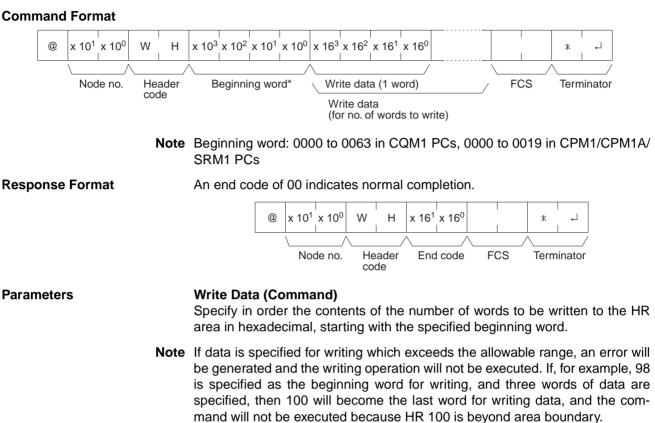

Specify in order the contents of the number of words to be written to the LR area in hexadecimal, starting with the specified beginning word.

Note If data is specified for writing which exceeds the allowable range, an error will be generated and the writing operation will not be executed. If, for example, 60 is specified as the beginning word for writing and five words of data are specified, then 64 will become the last word for writing data, and the command will not be executed because LR 64 is beyond area boundary.

Section 6-3

6-3-10 HR AREA WRITE --- WH

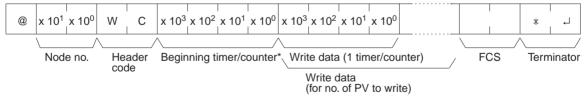

Writes data to the HR area, starting from the specified word. Writing is done word by word.

6-3-11 PV WRITE --- WC

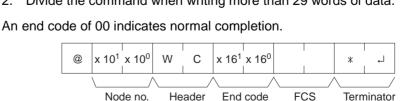

Writes the PVs (present values) of timers/counters starting from the specified timer/counter.

Command Format

Beginning T/C:0000 to 0511 in CQM1 PCs, 0000 to 0127 in CPM1/ Note 1. CPM1A/SRM1 PCs

2. Divide the command when writing more than 29 words of data.

code

Response Format

Write Data (Command)

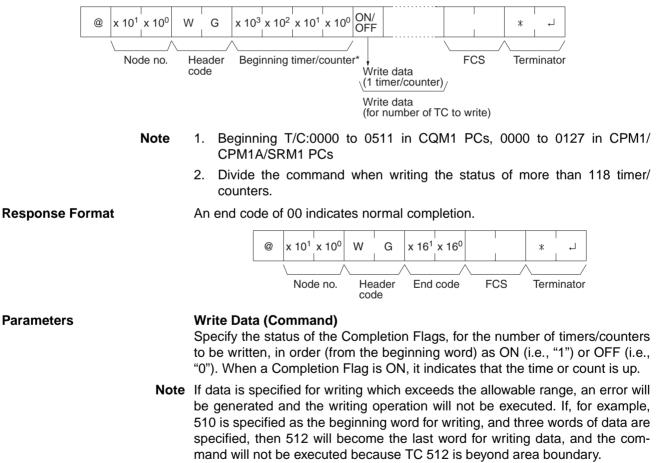

Specify in decimal numbers (BCD) the present values for the number of timers/counters that are to be written, starting from the beginning timer/counter.

- **Note** 1. When this command is used to write data to the PV area, the Completion Flags for the timers/counters that are written will be turned OFF.
 - 2. If data is specified for writing which exceeds the allowable range, an error will be generated and the writing operation will not be executed. If, for example, 510 is specified as the beginning word for writing, and three words of data are specified, then 512 will become the last word for writing data, and the command will not be executed because TC 512 is beyond area boundary.

6-3-12 TC STATUS WRITE --- WG

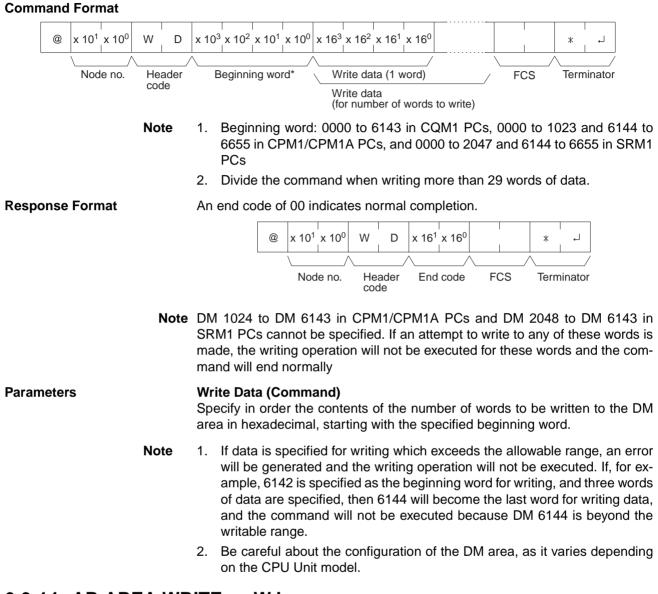

Writes the status of the Completion Flags for timers and counters in the TC area, starting from the specified timer/counter (number). Writing is done number by number.

Command Format

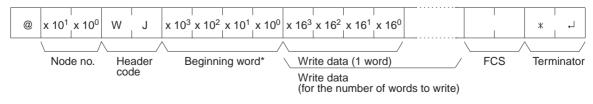

6-3-13 DM AREA WRITE --- WD

Writes data to the DM area, starting from the specified word. Writing is done word by word.

6-3-14 AR AREA WRITE --- WJ

Writes data to the AR area, starting from the specified word. Writing is done word by word.

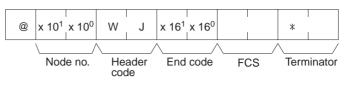

Command Format

Response Format

An end code of 00 indicates normal completion.

Parameters

Write Data (Command)

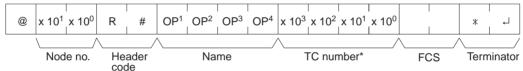

Specify in order the contents of the number of words to be written to the AR area in hexadecimal, starting with the specified beginning word.

Note If data is specified for writing which exceeds the allowable range, an error will be generated and the writing operation will not be executed. If, for example, 26 is specified as the beginning word for writing, and three words of data are specified, then 28 will become the last word for writing data, and the command will not be executed because AR 28 is beyond the writable range.

6-3-15 SV READ 1 --- R#

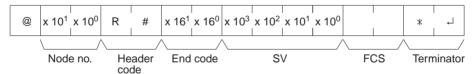

Searches for the first instance of a TIM, TIMH(15), CNT, and CNTR(12) instruction with the specified TC number in the user's program and reads the PV, which assumed to be set as a constant. The SV that is read is a 4-digit decimal number (BCD). The program is searched from the beginning, which may take as much as 10 seconds to produce a response.

Command Format

Note TC number: 0000 to 0511 in CQM1 PCs, 0000 to 0127 in CPM1/CPM1A/ SRM1 PCs

Response Format

Parameters

Name, TC Number (Command)

Specify the instruction for reading the SV in "Name." Make this setting in 4 characters. In "TC number," specify the timer/counter number used for the instruction.

	Instructi	on name	Classification	
OP1	OP2	OP3	OP4	
Т	1	М	(Space)	TIMER
Т	I	М	Н	HIGH-SPEED TIMER
С	Ν	Т	(Space)	COUNTER
С	Ν	Т	R	REVERSIBLE COUNTER

SV (Response)

The constant SV is returned.

Note

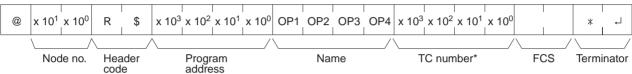

- 1. The instruction specified under "Name" must be in four characters.
 - 2. If the same instruction is used more than once in a program, only the first one will be read.

- 3. Use this command only when it is definite that a constant SV has been set.
- 4. The response end code will indicate an error (16) if the SV wasn't entered as a constant.

6-3-16 SV READ 2 - R\$

Reads the constant SV or the word address where the SV is stored. The SV that is read is a 4-digit decimal number (BCD) written as the second operand for the TIM, TIMH(15), CNT, or CNTR(12) instruction at the specified program address in the user's program. This can only be done with a program of less than 10K.

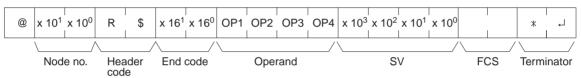

Command Format

Note TC number: 0000 to 0511 in CQM1 PCs, 0000 to 0127 in CPM1/CPM1A/ SRM1 PCs

Response Format

An end code of 00 indicates normal completion.

Parameters

Name, TC Number (Command)

Specify the name of the instruction for reading the SV in "Name." Make this setting in 4 characters. In "TC number," specify the timer/counter number used by the instruction.

	Instructi	on name	Classification	
OP1	OP2	OP3	OP4	
Т	I	М	(Space)	TIMER
Т	I	М	Н	HIGH-SPEED TIMER
С	Ν	Т	(Space)	COUNTER
С	Ν	Т	R	REVERSIBLE COUNTER

Operand, SV (Response)

The name that indicates the SV classification is returned to "Operand," and either the word address where the SV is stored or the constant SV is returned to "SV."

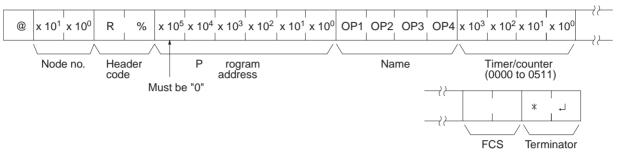

Operand				Classification	Constant or word address		
OP1	OP2	OP3	OP4		CQM1 PCs	CPM1 PCs	
С	I	0	(Space)	IR or SR	0000 to 0255	0000 to 0019 0200 to 0255	
L	R	(Space)	(Space)	LR	0000 to 0063	0000 to 0015	
Н	R	(Space)	(Space)	HR	0000 to 0099	0000 to 0019	
А	R	(Space)	(Space)	AR	0000 to 0027	0000 to 0015	
D	М	(Space)	(Space)	DM	0000 to 6655	0000 to 6655	
D	М	*	(Space)	DM (indirect)	0000 to 6655	0000 to 6655	
С	0	Ν	(Space)	Constant	0000 to 9999	0000 to 9999	

Note The instruction name specified under "Name" must be in four characters. Fill any gaps with spaces to make a total of four characters.

6-3-17 SV READ 3 — R% (CQM1 Only)

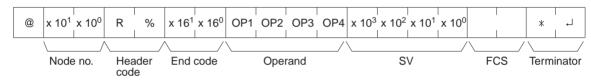

Reads the constant SV or the word address where the SV is stored. The SV that is read is a 4-digit decimal number (BCD) written in the second word of the TIM, TIMH(15), CNT, or CNTR(12) instruction at the specified program address in the user's program. With this command, program addresses can be specified for a program of 10K or more.

Command Format

Response Format

An end code of 00 indicates normal completion.

Parameters

Name, TC Number (Command)

Specify the name of the instruction for reading the SV in "Name." Make this setting in 4 characters. In "TC number," specify the timer/counter number used by the instruction.

Instruction name				Classification	TC number
OP1	OP2	OP3	OP4		range
Т	I	М	(Space)	TIMER	0000 to 0511
Т	I	М	Н	HIGH-SPEED TIMER	
С	Ν	Т	(Space)	COUNTER	
С	Ν	Т	R	REVERSIBLE COUNTER	

Operand, SV (Response)

The name that indicates the SV classification is returned to "Operand," and either the word address where the SV is stored or the constant SV is returned to "SV."

	Ор	erand		Classification	Constant or
OP1	OP2	OP3	OP4		word address
С	I	0	(Space)	IR or SR	0000 to 0255
L	R	(Space)	(Space)	LR	0000 to 0063
Н	R	(Space)	(Space)	HR	0000 to 0099
А	R	(Space)	(Space)	AR	0000 to 0027
D	М	(Space)	(Space)	DM	0000 to 6655
D	М	*	(Space)	DM (indirect)	0000 to 6655
С	0	N	(Space)	Constant	0000 to 9999

Note The instruction name specified under "Name" must be in four characters. Fill any gaps with spaces to make a total of four characters.

6-3-18 SV CHANGE 1 --- W#

Searches for the first instance of the specified TIM, TIMH(15), CNT, or CNTR(12) instruction in the user's program and changes the SV to new constant SV specified in the second word of the instruction. The program is searched from the beginning, and it may therefore take approximately 10 seconds to produce a response.

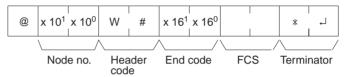

Command Format

Note TC number: 0000 to 0511 in CQM1 PCs, 0000 to 0127 in CPM1/CPM1A/ SRM1 PCs

Response Format

An end code of 00 indicates normal completion.

Parameters

Name, TC Number (Command)

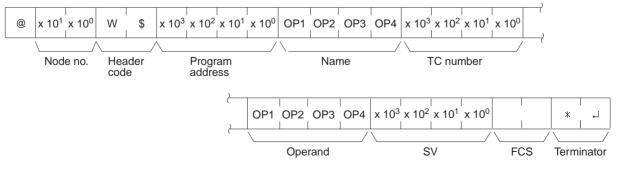

In "Name," specify the name of the instruction, in four characters, for changing the SV. In "TC number," specify the timer/counter number used for the instruction.

	Instructi	on name	Classification	
OP1	OP2	OP3	OP4	
Т	I	М	(Space)	TIMER
Т	I	М	Н	HIGH-SPEED TIMER
С	N	Т	(Space)	COUNTER
С	Ν	Т	R	REVERSIBLE COUNTER

6-3-19 SV CHANGE 2 --- W\$

Changes the contents of the second word of the TIM, TIMH(15), CNT, or CNTR(12) at the specified program address in the user's program. This can only be done with a program of less than 10K.

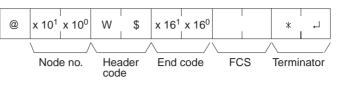

Command Format

Response Format

An end code of 00 indicates normal completion.

Parameters

Name, TC Number (Command)

In "Name," specify the name of the instruction, in four characters, for changing the SV. In "TC number," specify the timer/counter number used for the instruction.

	Instructi	ion name	Classification	
OP1	OP2	OP3	OP4	
Т	I	М	(Space)	TIMER
Т	I	М	Н	HIGH-SPEED TIMER
С	N	Т	(Space)	COUNTER
С	Ν	Т	R	REVERSIBLE COUNTER

Operand, SV (Response)

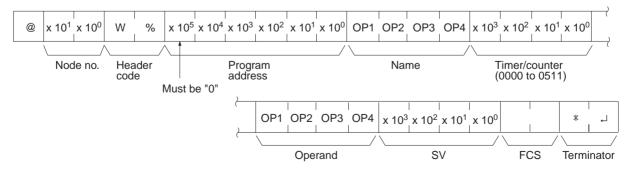

In "Operand," specify the name that indicates the SV classification. Specify the name in four characters. In "SV," specify either the word address where the SV is stored or the constant SV.

	0	perand		Classification	Constant or word address		
OP1	OP2	OP3	OP4		CQM1 PCs	CPM1 PCs	
С	I	0	(Space)	IR or SR	0000 to 0252	0000 to 0019 0200 to 0252	
L	R	(Space)	(Space)	LR	0000 to 0063	0000 to 0015	
Н	R	(Space)	(Space)	HR	0000 to 0099	0000 to 0019	
А	R	(Space)	(Space)	AR	0000 to 0027	0000 to 0015	
D	М	(Space)	(Space)	DM	0000 to 6655	0000 to 1023 6144 to 6655	
D	М	*	(Space)	DM (indirect)	0000 to 6655	0000 to 1023 6144 to 6655	
С	0	N	(Space)	Constant	0000 to 9999	0000 to 9999	

6-3-20 SV CHANGE 3 — W% (CQM1 Only)

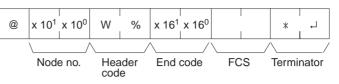

Changes the contents of the second word of the TIM, TIMH(15), CNT, or CNTR(12) at the specified program address in the user's program. With this command, program address can be specified for a program of more than 10K.

Command Format

Response Format

An end code of 00 indicates normal completion.

Parameters

Name, TC Number (Command)

In "Name," specify the name of the instruction, in four characters, for changing the SV. In "TC number," specify the timer/counter number used for the instruction.

Instruction name				Classification	TC number
OP1	OP2	OP3	OP4		range
Т	I	М	(Space)	TIMER	0000 to 0511
Т	I	М	Н	HIGH-SPEED TIMER	
С	Ν	Т	(Space)	COUNTER	
С	Ν	Т	R	REVERSIBLE COUNTER	

Operand, New SV (Response)

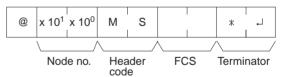

In "Operand," specify the name that indicates the SV classification. Specify the name in four characters. In "SV," specify either the word address where the SV is stored or the constant SV.

	Ор	erand		Classification	Constant or
OP1	OP2	OP3	OP4		word address
С	I	0	(Space)	IR or SR	0000 to 0252
L	R	(Space)	(Space)	LR	0000 to 0063
Н	R	(Space)	(Space)	HR	0000 to 0099
А	R	(Space)	(Space)	AR	0000 to 0027
D	М	(Space)	(Space)	DM	0000 to 6655
D	М	*	(Space)	DM (indirect)	0000 to 6655
С	0	Ν	(Space)	Constant	0000 to 9999

6-3-21 STATUS READ --- MS

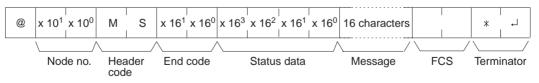

Reads the PC operating conditions.

Command Format

Response Format

An end code of 00 indicates normal completion.

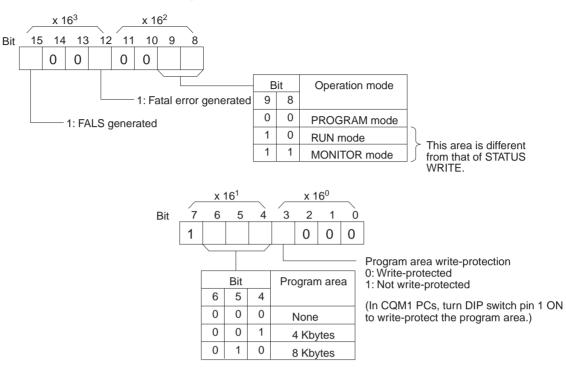

Host Link Commands

Section 6-3

Status Data, Message (Response)

"Status data" consists of four digits (two bytes) hexadecimal. The leftmost byte indicates CPU Unit operation mode, and the rightmost byte indicates the size of the program area.

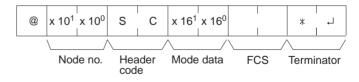

In CQM1 PCs, the "Message" parameter is a FAL/FALS number that exists when the command is executed. When there is no message, this parameter is omitted.

In CPM1/CPM1A/SRM1 PCs, the "Message" parameter is a 16-character message that exists when the command is executed. When there is no message, this parameter is omitted.

6-3-22 STATUS WRITE --- SC

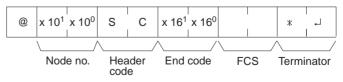

Changes the PC operating mode.

Command Format

Response Format

An end code of 00 indicates normal completion.

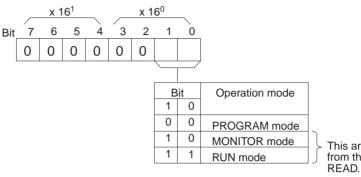

380

Parameters

Mode Data (Command)

"Mode data" consists of two digits (one byte) hexadecimal. With the leftmost two bits, specify the PC operating mode. Set all of the remaining bits to "0."

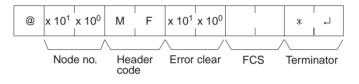

This area is different from that of STATUS READ.

6-3-23 ERROR READ --- MF

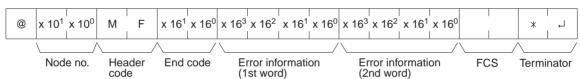

Reads and clears errors in the PC. Also checks whether previous errors have been cleared.

Command Format

Response Format

An end code of 00 indicates normal completion.

Parameters

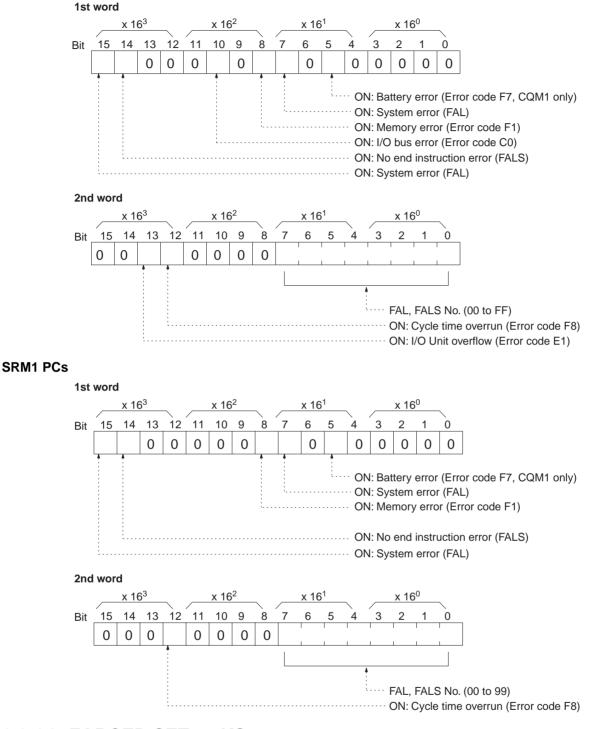

Error Clear (Command)

Specify 01 to clear errors and 00 to not clear errors (BCD). Fatal errors can be cleared only when the PC is in PROGRAM mode.

Error Information (Response)

The error information comes in two words.

CQM1/CPM1/CPM1A PCs

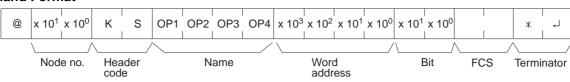

6-3-24 FORCED SET --- KS

Force sets a bit in the IR, SR, LR, HR, AR, or TC area. Just one bit can be force set at a time.

Once a bit has been forced set or reset, that status will be retained until a FORCED SET/RESET CANCEL (KC) command or the next FORCED SET/ RESET command is transmitted.

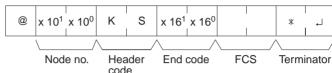

Host Link Commands

Command Format

Response Format

An end code of 00 indicates normal completion.

Parameters

Name, Word address, Bit (Command)

In "Name," specify the area (i.e., IR, SR, LR, HR, AR, or TC) that is to be forced set. Specify the name in four characters. In "Word address," specify the address of the word, and in "Bit" the number of the bit that is to be forced set.

	Name			Classification	Word addres	Word address setting range		
OP1	OP2	OP3	OP4		CQM1 PCs	CPM1/ CPM1A/ SRM1 PCs		
С	I	0	(Space)	IR or SR	0000 to 0252	0000 to 0019 0200 to 0252	00 to 15 (decimal)	
L	R	(Space)	(Space)	LR	0000 to 0063	0000 to 0015		
Н	R	(Space)	(Space)	HR	0000 to 0099	0000 to 0019		
А	R	(Space)	(Space)	AR	0000 to 0027	0000 to 0015		
Т	I	М	(Space)	Completion Flag (timer)	0000 to 0511	0000 to 0127	Always 00	
Т	I	М	Н	Completion Flag (high-speed timer)				
С	Ν	Т	(Space)	Completion Flag (counter)]			
С	Ν	Т	R	Completion Flag (reversible counter)]			

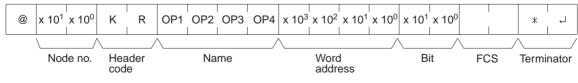

Note The area specified under "Name" must be in four characters. Add spaces after the data area name if it is shorter than four characters.

6-3-25 FORCED RESET --- KR

Force resets a bit in the IR, SR, LR, HR, AR, or TC area. Just one bit can be force reset at a time.

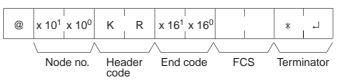

Once a bit has been forced set or reset, that status will be retained until a FORCED SET/RESET CANCEL (KC) command or the next FORCED SET/ RESET command is transmitted.

Command Format

Response Format

An end code of 00 indicates normal completion.

Host Link Commands

Parameters

Name, Word address, Bit (Command)

In "Name," specify the area (i.e., IR, SR, LR, HR, AR, or TC) that is to be forced reset. Specify the name in four characters. In "Word address," specify the address of the word, and in "Bit" the number of the bit that is to be forced reset.

	Name			Classification	Word addres	Bit	
OP1	OP2	OP3	OP4		CQM1 PCs	CPM1/CPM1A/ SRM1 PCs	
С	I	0	(Space)	IR or SR	0000 to 0252	0000 to 0019 0200 to 0252	00 to 15 (decimal)
L	R	(Space)	(Space)	LR	0000 to 0063	0000 to 0015	
Н	R	(Space)	(Space)	HR	0000 to 0099	0000 to 0019	
А	R	(Space)	(Space)	AR	0000 to 0027	0000 to 0015	
Т	I	М	(Space)	Completion Flag (timer)	0000 to 0511	0000 to 0127	Always 00
Т	I	Μ	Н	Completion Flag (high-speed timer)			
С	Ν	Т	(Space)	Completion Flag (counter)			
С	Ν	Т	R	Completion Flag (reversible counter)			

Note The area specified under "Name" must be in four characters. Add spaces after the data area name if it is shorter than four characters.

6-3-26 MULTIPLE FORCED SET/RESET — FK

Force sets, force resets, or cancels the status of the bits in one word in the IR, SR, LR, HR, AR, or TC area.

Command Format

	Name			Classification	Word addre	ess setting range
OP1	OP2	OP3	OP4		CQM1 PCs	CPM1/CPM1A/SRM1 PCs
С	I	0	(Space)	IR or SR	0000 to 0252	0000 to 0019 0200 to 0252
L	R	(Space)	(Space)	LR	0000 to 0063	0000 to 0015
Н	R	(Space)	(Space)	HR	0000 to 0099	0000 to 0019
А	R	(Space)	(Space)	AR	0000 to 0027	0000 to 0015
Т	I	М	(Space)	Completion Flag (timer)	0000 to 0511	0000 to 0127
Т	I	М	Н	Completion Flag (high-speed timer)		
С	Ν	Т	(Space)	Completion Flag (counter)		
С	Ν	Т	R	Completion Flag (reversible counter)		

Forced set/Reset/Cancel data (Command)

If a timer or counter completion flag is specified, only bit 15 is effective and all other bits will be ignored. Only force-setting and force-resetting are possible for timers/counters.

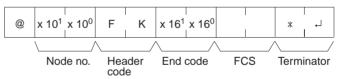

If a word address is specified, the content of the word specifies the desired process for each bit in the specified word, as shown in the following table.

Hexadecimal setting	Process
0000	No action (bit status not changed)
0002	Reset
0003	Set
0004	Forced-reset
0005	Forced-set
0008	Forced set/reset status cancel

The bits that are merely set or reset may change status the next time the program is executed, but bits that are force-set or force-reset will maintain the forced status until it is cleared.

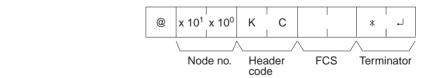

Response Format

An end code of 00 indicates normal completion.

6-3-27 FORCED SET/RESET CANCEL — KC

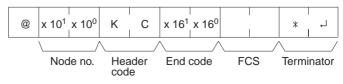

Cancels all forced set and forced reset bits (including those set by FORCED SET, FORCED RESET, and MULTIPLE FORCED SET/RESET). If multiple bits are set, the forced status will be cancelled for all of them. It is not possible to cancel bits one by one using KC.

Response Format

Command Format

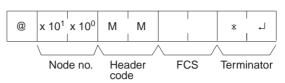

An end code of 00 indicates normal completion.

6-3-28 PC MODEL READ --- MM

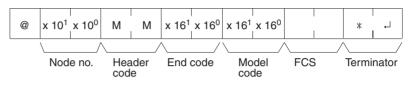

Reads the model type of the PC.

Command Format

Response Format

An end code of 00 indicates normal completion.

Parameters

Model Code

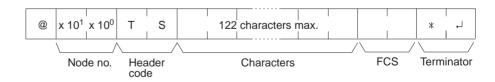

"Model code" indicates the PC model in two digits hexadecimal.

Model code	Model
01	C250
02	C500
03	C120
0E	C2000
10	C1000H
11	C2000H/CQM1/CPM1/CPM1A/SRM1
12	C20H/C28H/C40H/C200H/C200HS
20	CV500
21	CV1000
22	CV2000
40	CVM1-CPU01-E
41	CVM1-CPU11-E
42	CVM1-CPU21-E

6-3-29 TEST---- TS

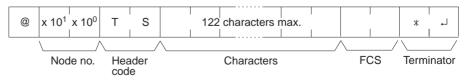

Returns, unaltered, one block of data transmitted from the host computer.

Command Format

Response Format

An end code of 00 indicates normal completion.

Parameters

Characters (Command, Response)

For the command, this setting specifies any characters other than the carriage return (CHR\$(13)). For the response, the same characters as specified by the command will be returned unaltered if the test is successful.

┛

*

Terminator

6-3-30 PROGRAM READ — RP

Reads the contents of the PC user's program area in machine language (object code). The contents are read as a block, from the beginning to the end.

Ρ

FCS

R

Header

code

Command Format

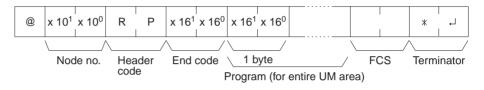

Response Format

x 10¹ x 10⁰

Node no.

@

Parameters

Program (Response)

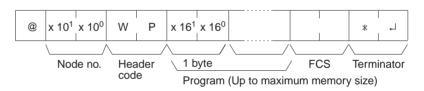

The program is read from the entire program area.

Note To stop this operation in progress, execute the ABORT (XZ) command.

6-3-31 PROGRAM WRITE --- WP

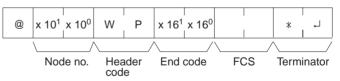

Writes to the PC user's program area the machine language (object code) program transmitted from the host computer. The contents are written as a block, from the beginning.

Command Format

Response Format

An end code of 00 indicates normal completion.

Parameters

Program (Command)

Program data up to the maximum memory size.

6-3-32 COMPOUND COMMAND — QQ

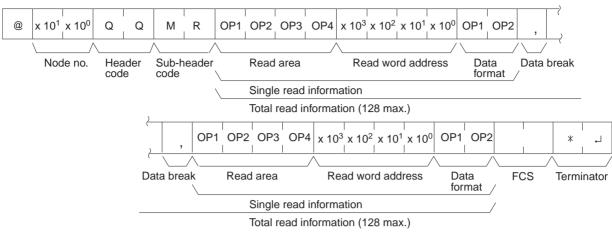

Registers at the PC all of the bits, words, and timers/counters that are to be read, and reads the status of all of them as a batch.

Registering Read Information

Register the information on all of the bits, words, and timers/counters that are to be read.

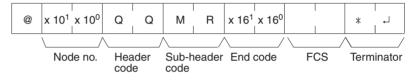

Host Link Commands

Command Format

Response Format

An end code of 00 indicates normal completion.

Parameters

Read Area (Command)

Specify in four-character code the area that is to be read. The codes that can be specified are listed in the following table.

Read Word address, Data Format (Command)

Depending on the area and type of data that are to be read, the information to be read is as shown in the following table. The "read data" is specified in four digits BCD, and the data format is specified in two digits BCD.

Area classification	Read data	Read area	Read	l word	Data format
			CQM1 PCs	CPM1/ CPM1A/ SRM1 PCs	
IR or SR	Bit	CIO(S)	0000 to 0255	0000 to 0019	00 to 15 (decimal)
	Word			0200 to 0255	"CH"
LR	Bit	L R (S) (S)	0000 to 0063	0000 to 0015	00 to 15 (decimal)
	Word				"CH"
HR	Bit	H R (S) (S)	0000 to 0099	0000 to 0019	00 to 15 (decimal)
	Word				"CH"
AR	Bit	A R (S) (S)	0000 to 0027	0000 to 0015	00 to 15 (decimal)
	Bit				"CH"
Timer	Completion Flag	TIM(S)	0000 to 0511	0000 to 0127	2 characters other than "CH"
	PV				"CH"
High-speed timer	Completion Flag	тімн	0000 to 0511	0000 to 0127	2 characters other than "CH"
	PV				"CH"
Counter	Completion Flag	CNT(S)	0000 to 0511	0000 to 0127	2 characters other than "CH"
	PV				"CH"
Reversible counter	Completion Flag	CNTR	0000 to 0511	0000 to 0127	2 characters other than "CH"
	PV	7			"CH"
DM	Word	D M (S) (S)	0000 to 6655	0000 to 1023* 6144 to 6655	Any 2 characters

Note *For SRM1 PCs, the DM range is from 0000 to 2047.

(S): Space

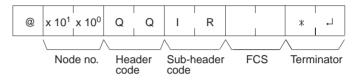

Data Break (Command)

The read information is specified one item at a time separated by a break code (,). The maximum number of items that can be specified is 128. (When the PV of a timer/counter is specified, however, the status of the Completion Flag is also returned, and must therefore be counted as two items.)

Batch Reading

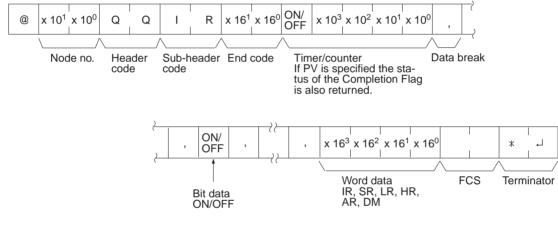

The bit, word, and timer/counter status is read as a batch according to the read information that was registered with QQ.

Command Format

Response Format

An end code of 00 indicates normal completion.

Parameters

Read Data (Response)

Read data is returned according to the data format and the order in which read information was registered using QQ. If "Completion Flag" has been specified, then bit data (ON or OFF) is returned. If "Word" has been specified, then word data is returned. If "PV" has been specified for timers/counters, however, then the PV is returned following the Completion Flag.

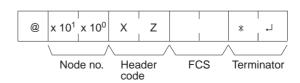

Data Break (Response)

The break code (,) is returned between sections that are read.

6-3-33 ABORT --- XZ

Aborts the Host Link operation that is currently being processed, and then enables reception of the next command. The ABORT command does not receive a response.

Command Format

6-3-34 INITIALIZE --- **

Initializes the transmission control procedure of all the PCs connected to the host computer. The INITIALIZE command does not use node numbers or FCS, and does not receive a response.

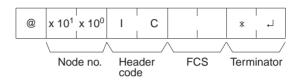

Command Format

6-3-35 Undefined Command — IC

This response is returned if the header code of a command cannot be decoded. Check the header code.

Response Format

SECTION 7 PC Operations and Processing Time

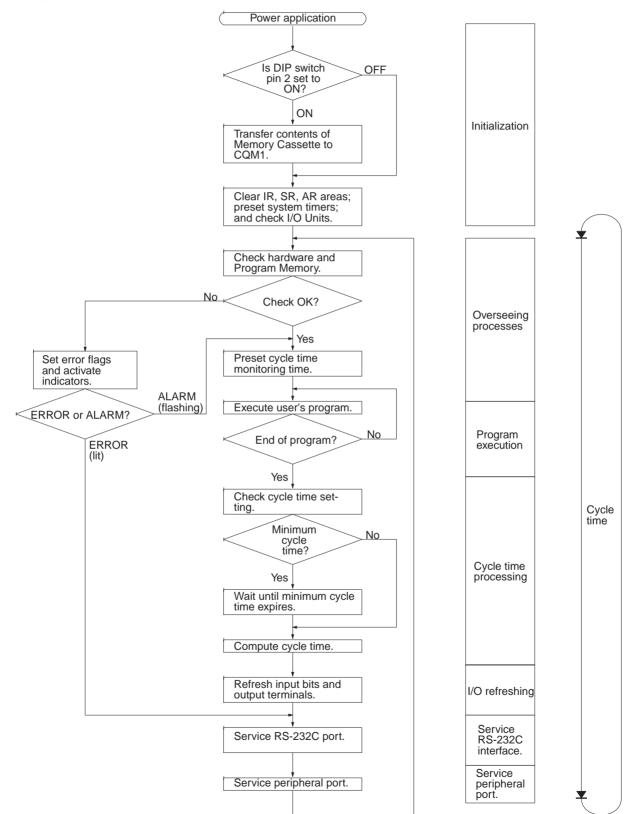

This section explains the internal processing of the CQM1/CPM1A/SRM1, and the time required for processing and execution. Refer to this section to gain an understanding of the precise timing of CQM1/CPM1A/SRM1 operation.

7-1	CQM1	Cycle Time and I/O Response Time	392
	7-1-1	The CQM1 Cycle	392
	7-1-2	CQM1 Cycle Time	393
	7-1-3	I/O Response Time	395
	7-1-4	One-to-one Link I/O Response Time	396

7-1 CQM1 Cycle Time and I/O Response Time

7-1-1 The CQM1 Cycle

CQM1 Operation Flowchart The overall flow of CQM1 operation is as shown in the following flowchart.

One cycle of CPU Unit operation is called a cycle. The time required for one cycle is called the cycle time.

I/O Refresh Methods CQM1 I/O refresh operations are broadly divided into two categories. The first of these, input refresh, involves reading the ON/OFF status of input points to the input bits. The second, output refresh, involves writing the ON/OFF status after program execution to the output points. The CQM1 I/O refresh methods are as shown in the following table.

Input/Output	I/O refresh method	Function
Input	Cyclic refresh	Input refresh is executed at a set time once per cycle.
	Interrupt input refresh	Input refresh is executed before execution of the interrupt processing rou- tine whenever an input interrupt, interval timer interrupt, or high-speed counter interrupt occurs. (The cyclic refresh is also executed.)
Output	Cyclic refresh	Output refresh is executed at a set time once per cycle.
	Direct refresh	When there is an output from the user's program, that output point is imme- diately refreshed. (The cyclic refresh is also executed.)

The initial status of the CQM1 I/O refresh is as follows:

Input: Only cyclic refresh executed.

Output: Only cyclic refresh executed.

Cyclic refresh must be executed for both inputs and outputs. If input refresh is to be executed at the time of interrupts, then set the input refresh range in the PC Setup (DM 6630 to DM 6638). Stopping direct refresh can be set in DM 6639 of the PC Setup.

In addition to the methods described above, it is also possible to execute I/O refreshes in the program by means of IORF(97).

7-1-2 CQM1 Cycle Time

The processes involved in a single CQM1 cycle are shown in the following table, and their respective processing times are explained.

Process	Content	Time requirements
Overseeing	Setting cycle watchdog timer, I/O bus check, UM check, refreshing clock, refreshing bits allocated to	0.8 ms (0.9 ms when a Memory Cassette equipped with a clock is mounted)
	new functions, etc.	Add an additional 0.1 ms for the CQM1- CPU4□-EV1 CPU Units.
Program execution	User program is executed.	Total time for executing instructions. (Varies according to content of user's program.)
Cycle time calculation	Standby until set time, when minimum cycle time is set in DM 6619 of PC Setup. Calculation of cycle time.	Almost instantaneous, except for standby processing.
I/O refresh	Input Unit's input information is read to input bits. Output information (results of executing program) is written to Output Unit's output bits.	Number of input words \times 0.01 ms
RS-232C port servicing	Devices connected to RS-232C port serviced.	5% or less of cycle time (see note)
Peripheral port servicing	Devices connected to peripheral port serviced.	5% or less of cycle time (see note)

Note The percentages can be changed in the PC Setup (DM 6616, DM 6617).

Cycle Time and Operations

Cycle Time Example

The effects of the cycle time on CQM1 operations are as shown below.

Cycle time	Operation conditions			
10 ms or longer	TIMH(15) may be inaccurate when TC 016 through TC 511 are used (operation will be normal for TC 000 through TC 015) (see note 1).			
20 ms or longer	Programming	Programming using the 0.02-second Clock Bit (SR 25401) may be inaccurate.		
100 ms or longer	Programming using the 0.1-second Clock Bit (SR 25500) may be inaccurate. A CYCLE TIME OVER error is generated (SR 25309 will turn ON) (see note 2).			
120 ms or longer	The FALS 9F monitoring time SV is exceeded. A system error (FALS 9F) is generated, and operation stops (see note 3).			
200 ms or longer	Programming using the 0.2-second Clock Bit (SR 25501) may be inaccurate.			
	Note		The number of timers to undergo interrupt processing can be set in DM 6629 of the PC Setup. The default setting is for TC 000 through TC 015.	
			The PC Setup (DM 6655) can be used to disable detection of CYCLE TIME OVER error.	

3. The FALS 9F cycle monitoring time can be changed by means of the PC Setup (DM 6618).

In this example, the cycle time is calculated for a CQM1 with 80 I/O points. The I/O is configured as follows:

DC inputs: 48 points (3 words) Bit outputs: 32 points (2 words)

The rest of the operating conditions are assumed to be as follows:

User's program:2,000 instructions (configured of LD and OUT instructions) Clock: None RS-232C port: Not used

Cycle time: Variable (no minimum set)

Note The average processing time for a single instruction in the user's program is assumed to be 0.625 $\mu s.$

Process	Calculation method	Time with peripheral device	Time without peripheral device
Overseeing	Fixed	0.8 ms	0.8 ms
Program execution	0.625×2000 (μs)	1.25 ms	1.25 ms
Cycle time calculation	Negligible	0 ms	0 ms
I/O refresh	0.01 × 3 + 0.005 × 2 (μs)	0.04 ms	0.04 ms
RS-232C port servicing	Not used.	0 ms	0 ms
Peripheral port servicing	Minimum time	0.34 ms	0 ms
Cycle time	(1) + (2) + (3) + (4) + (5) + (6)	2.43 ms	2.09 ms

The cycle times are as shown in the following table.

Note

 The cycle time can be automatically read from the PC via a Peripheral Device.

- 2. The maximum and current cycle time are stored in AR 26 and AR 27.
- 3. The cycle time can vary with actual operating conditions and will not necessarily agree precisely with the calculated value.
- 4. The RS-232C and peripheral port service time will be 0.34 ms minimum, 87 ms maximum.

7-1-3 I/O Response Time

The I/O response time is the time it takes after an input signal has been received (i.e., after an input bit has turned ON) for the PC to check and process the information and to output a control signal (i.e., to output the result of the processing to an output bit). The I/O response time varies according to the timing and processing conditions.

The minimum and maximum I/O response times are shown here, using the following program as an example.

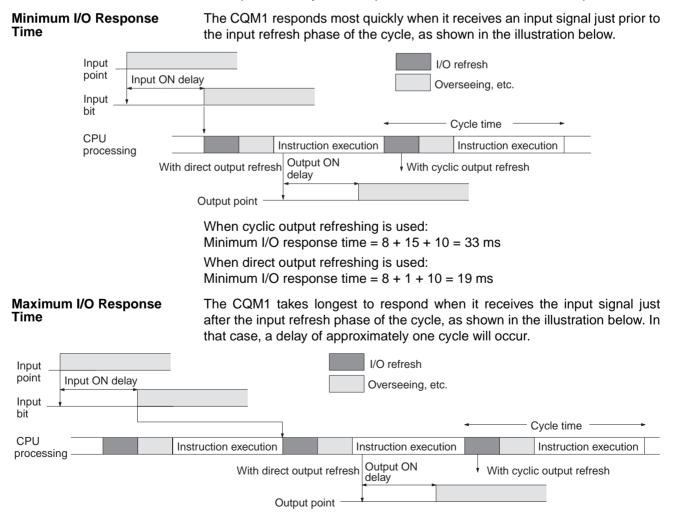

The following conditions are taken as examples for calculating the I/O response times.

Input ON delay:
Overseeing time:
Instruction execution time:
Output ON delay:
Position of output instruction:
Communications ports:

8 ms 1 ms 14 ms 10 ms Beginning of program Not used.

Note The input ON delay for DC Input Units can be set in the PC Setup.

When cyclic output refreshing is used: Minimum I/O response time = $8 + 15 \times 2 + 10 = 48$ ms When direct output refreshing is used: Minimum I/O response time = 8 + 15 + 10 = 33 ms

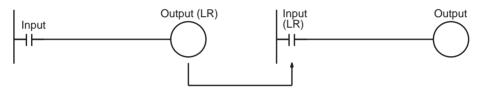

7-1-4 One-to-one Link I/O Response Time

When two CQM1s are linked one-to-one, the I/O response time is the time required for an input executed at one of the CQM1s to be output to the other CQM1 by means of one-to-one link communications.

One-to-one link communications are carried out reciprocally between the master and the slave. The respective transmission times are as shown below, depending on the number of LR words used.

Number of words used	Transmission time
64 words (LR 00 to LR 63)	39 ms
32 words (LR 00 to LR 31)	20 ms
16 words (LR 00 to LR 15)	10 ms

The minimum and maximum I/O response times are shown here, using as an example the following instructions executed at the master and the slave. In this example, communications proceed from the master to the slave.

The following conditions are taken as examples for calculating the I/O response times.

Input ON delay:	8 ms
Master cycle time:	10 ms
Slave cycle time:	14 ms
Output ON delay:	10 ms
Direct output:	Not used.
Number of LR words:	64

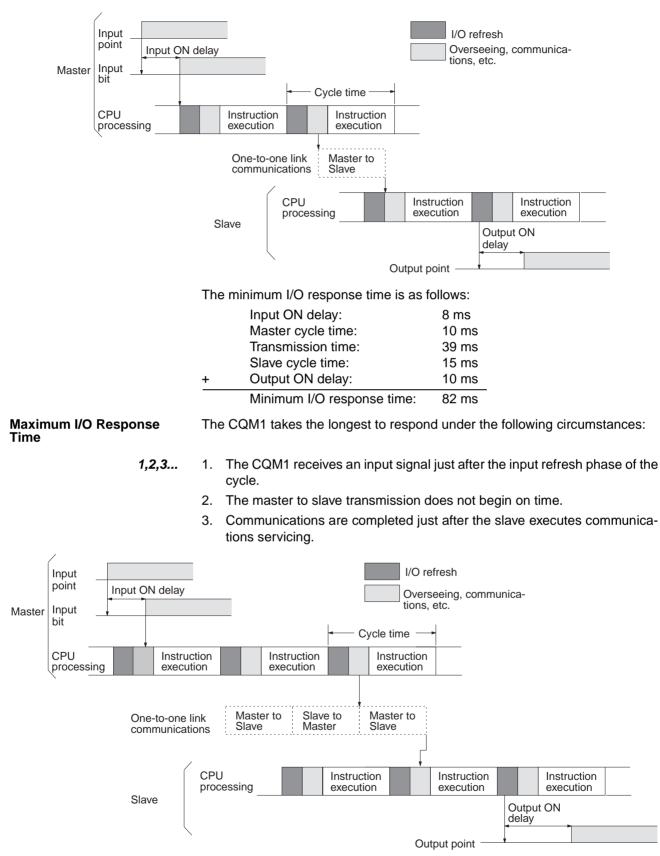

Note The input ON delay for DC Input Units can be set in the PC Setup.

Minimum I/O Response Time

- .
 - **1,2,3...** 1. The CQM1 receives an input signal just prior to the input refresh phase of the cycle.

The CQM1 responds most quickly under the following circumstances:

2. The master to slave transmission begins immediately.

3. The slave executes communications servicing immediately after completion of communications. The maximum I/O response time is as follows:

	M. '	1
+	Output ON delay:	10 ms
	Slave cycle time:	15 ms imes 2
	Transmission time:	39 ms imes 3
	Master cycle time:	$10 \text{ ms} \times 2$
	Input ON delay:	8 ms

Maximum I/O response time:185 ms

7-1-5 Interrupt Processing Time

This section explains the processing times involved from the time an interrupt is executed until the interrupt processing routine is called, and from the time an interrupt processing routine is completed until returning to the original position. The explanation applies to the following three types of interrupts: input interrupts, interval timer interrupts, and high-speed counter interrupts.

Processing Time The table below shows the times involved from the generation of an interrupt signal until the interrupt processing routine is called, and from when the interrupt processing routine is completed until returning to the original position.

Item	Contents	Time
Interrupt input ON delay	This is the delay time from the time the interrupt input bit turns ON until the time that the interrupt is executed. This is unrelated to other interrupts.	50 μs
	\downarrow (Interrupt condition realized.) (see note)	
Standby until completion of interrupt-mask pro- cessing	This is the time during which interrupts are waiting until processing has been completed. This situation occurs when a mask pro- cesses is executed. It is explained below in more detail.	See below.
	\downarrow	
Change-to-interrupt pro- cessing	This is the time it takes to change processing to an interrupt.	40 μs
	↓	•
Input refresh at time of interrupt	This is the time required for input refresh when input refresh is set to be executed at the time the interrupt processing routine is called. (Set in PC Setup, DM 6630 to DM 6638.)	10 μs per word
	\downarrow (Interrupt processing routine executed)	
Return	This is the time it takes, from execution of RET(93), to return to the processing that was interrupted.	40 µs

Note 1. When high-speed counter 0 is used with a range comparison table, the timing of interrupt processing can be affected by the cycle time.

2. When high-speed counters 1 and 2 are used with range comparison tables (in CQM1-43/44-EV1 CPU Units), the timing of interrupt processing can be delayed up to 1 ms.

Mask Processing

Interrupts are masked during processing of the operations described below. Until the processing is completed, any interrupts will remain masked for the indicated times.

High-speed timers:The time shown below is required, depending on (a) the number of timers used with TIMH(15) and (b) the number of high-speed timers active at that time. (The number of high-speed timers is set in the PC Setup, DM 6629. The default setting is 16.)

 $0 \leq$ Standby time $\leq 50 + 3 \times (a + b) \mu s$

Up to 50 μs can be required even when no high-speed timers are used.

	Generation and clearing of non-ratal errors: When a non-fatal error is generated and the error contents are registered at the CQM1, or when an error is being cleared, interrupts will be masked for a maximum of 100 μ s until the processing has been completed.			
	Online editing: Interrupts will be masked for a maximum of 1 second when online editing is executed during operation.			
	Pulse output based on SPED(64) may also be affected by interrupt process- ing, thus causing output timing to vary.			
Example Calculation	This example shows the interrupt response time (i.e., the time from when the interrupt input turns ON until the start of the interrupt processing routine) when input interrupts are used under the conditions shown below.			
	Number high-speed timers: 0 (No high-speed timers started) Online edit: Not used Input refresh at interrupt: No			
	Minimum Response Time			
	Interrupt input ON delay: 50 μs Interrupt mask standby time: 0 μs			
	+ Change-to-interrupt processing: 40 μs			
	Minimum response time: 90 μs			
	Maximum Response Time			
	Interrupt input ON delay: 50 μs			
	Interrupt mask standby time: 50 μs			
	+ Change-to-interrupt processing: 40 μs			
	Minimum response time: 140 μs			
	In addition to the response time above above the time required for everyting			

Generation and clearing of non-fatal errors

In addition to the response time shown above, the time required for executing the interrupt processing routine itself and a return time of 40 μ s must also be accounted for when returning to the process that was interrupted.

Be sure to allow for interrupt processing time when using interrupts in the program.

Outputs from interrupt routines can be output immediately if direct output is used. Direct output will be used for both the main program and the interrupt routines, and cannot be set separately.

7-1-6 CQM1 Instruction Execution Times

The following table lists the execution times for CQM1 instructions. The maximum and minimum execution times and the conditions which cause them are given where relevant. When "word" is referred to in the Conditions column, it implies the content of any word except for indirectly addressed DM words. Indirectly addressed DM words, which create longer execution times when used, are indicated by "*DM."

Execution times for most instructions depend on whether they are executed with an ON or an OFF execution condition. Exceptions are the ladder diagram instructions OUT and OUT NOT, which require the same time regardless of the execution condition. The OFF execution time for an instruction can also vary depending on the circumstances, i.e., whether it is in an interlocked program section and the execution condition for IL is OFF, whether it is between JMP(04) and JME(05) and the execution condition for JMP(04) is OFF, or whether it is reset by an OFF execution condition. "RSET," "IL," and "JMP" are used to indicate these three times.

Basic Instructions

Code	Mnemonic	ON execution	Conditions (Top: min.; bottom: max.)	OFF execution time (µs)		ne (μs)
		time (μs)		RSET	IL	JMP
	LD	0.5	Any			
	LD NOT					
	AND					
	AND NOT					
	OR					
	OR NOT					
	AND LD					
	OR LD					
	OUT	0.75	Without direct outputs or for operands other than			
	OUT NOT		IR 10000 to IR 11515 when direct outputs are			
			used.			
	SET	1.25	Direct outputs			
	RSET	1.25	Direct outputs			
	TIM	1.5	Constant for SV	1.5	1.5	1.5
			*DM for SV	54.1	1.5	1.5
	CNT	1.5	Constant for SV	1.5	1.5	1.5
			*DM for SV	51.6	1.5	1.5

7-2 CPM1/CPM1A Cycle Time and I/O Response Time

7-2-1 The CPM1/CPM1A Cycle

The overall flow of CPM1/CPM1A operation is as shown in the following flowchart.

Note Initialization processes include clearing the IR, SR, and AR areas, presetting system timers, and checking I/O Units.

7-2-2 CPM1/CPM1A Cycle Time

The processes involved in a single CPM1/CPM1A cycle are shown in the following table, and their respective processing times are explained.

Process	Content	Time requirements
Overseeing	Setting cycle watchdog timer, I/O bus check, UM check, clock refreshing, refreshing bits allocated to new functions, etc.	0.6 ms
Program execution	User program is executed.	Total time for executing instructions. (Varies according to content of user's program.)
Cycle time calculation	Standby until set time, when minimum cycle time is set in DM 6619 of PC Setup.	Almost instantaneous, except for standby processing.
	Calculation of cycle time.	
I/O refresh	Input information is read to input bits. Output information (results of executing program) is written to output bits.	10-point CPU : 0.06 ms 20-point CPU: 0.06 ms 30-point CPU: 0.3 ms Expansion I/O Unit 0.3 ms
Peripheral port servicing	Devices connected to peripheral port serviced.	0.26 ms min., 5% or less of cycle time up to 66 ms (see note)

Note The percentage of the cycle allocated to peripheral port servicing can be changed in the PC Setup (DM 6617).

Cycle Time and Operations

The effects of the cycle time on CPM1/CPM1A operations are as shown below. When a long cycle time is affecting operation, either reduce the cycle time or improve responsiveness with interrupt programs.

Cycle time	Operation conditions	
10 ms or longer	TIMH(15) may be inaccurate when TC 004 through TC 127 are used (operation will be normal for TC 000 through TC 003).	
20 ms or longer	Programming using the 0.02-second Clock Bit (SR 25401) may be inaccurate.	
100 ms or longer	TIM may be inaccurate. Programming using the 0.1-second Clock Bit (SR 25500) may be inaccurate. A CYCLE TIME OVER error is generated (SR 25309 will turn ON). See note 1.	
120 ms or longer	The FALS 9F monitoring time SV is exceeded. A system error (FALS 9F) is generated, and operation stops. See note 2.	
200 ms or longer	Programming using the 0.2-second Clock Bit (SR 25501) may be inaccurate.	

Note 1. The PC Setup (DM 6655) can be used to disable detection of CYCLE TIME OVER error.

2. The cycle monitoring time can be changed in the PC Setup (DM 6618).

Cycle Time Example In this example, the cycle time is calculated for a CPM1/CPM1A CPU Unit with 20 I/O points (12 input points and 8 output points). The I/O is configured as follows:

Inputs: 1 word (00000 to 00011) Outputs: 1 word (01000 to 01007)

The rest of the operating conditions are assumed to be as follows:

User's program: 500 instructions (consists of only LD and OUT) Cycle time: Variable (no minimum set)

CPM1/CPM1A Cycle Time and I/O Response Time

Section 7-2

The average processing time for a single instruction in the user's program is assumed to be 2.86 $\mu s.$ The cycle times are as shown in the following table.

Process	Calculation method	Time with peripheral device	Time without peripheral device
1. Overseeing	Fixed	0.6 ms	0.6 ms
2. Program execution	2.86 × 500 (μs)	1.43 ms	1.43 ms
3. Cycle time calculation	Negligible	0 ms	0 ms
4. I/O refresh	$0.01 \times 1 + 0.005 \times 1 \ (\mu s)$	0.06 ms	0.06 ms
5. Peripheral port servicing	Minimum time	0.26 ms	0 ms
Cycle time	(1) + (2) + (3) + (4) + (5)	2.35 ms	2.09 ms

Note 1. The cycle time can be read from the PC via a Peripheral Device.

- 2. The maximum and current cycle time are stored in AR 14 and AR 15.
 - 3. The cycle time can vary with actual operating conditions and will not necessarily agree precisely with the calculated value.

7-2-3 I/O Response Time

The I/O response time is the time it takes after an input signal has been received (i.e., after an input bit has turned ON) for the PC to check and process the information and to output a control signal (i.e., to output the result of the processing to an output bit). The I/O response time varies according to the timing and processing conditions.

The minimum and maximum I/O response times are shown here, using the following program as an example.

The following conditions are taken as examples for calculating the I/O response times.

Input ON delay: Overseeing time: Instruction execution time: Output ON delay: Peripheral port: 8 ms (input time constant: default setting) 1 ms (includes I/O refresh for CPM1A) 14 ms 10 ms Not used.

Minimum I/O Response Time

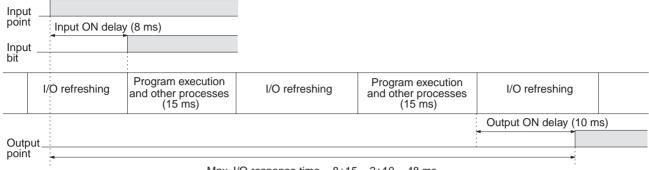

The CPM1/CPM1A responds most quickly when it receives an input signal just prior to I/O refreshing, as shown in the illustration below.

Input point						
point	Input ON dela	y (8 ms)	_			
Input bit			_			
DIL						
		I/O refreshing	Program execution and other processes (15 ms)	I/O refreshing		
				Output ON delay (10) ms)	
Output_ point				• • • •		
point	4					

Maximum I/O Response Time

The CPM1/CPM1A takes longest to respond when it receives the input signal just after the input refresh phase of the cycle, as shown in the illustration below. In that case, a delay of approximately one cycle will occur.

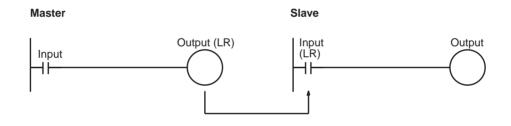

Max. I/O response time = 8+15 2+10 = 48 ms

7-2-4 One-to-one Link I/O Response Time

When two CPM1/CPM1As are linked one-to-one, the I/O response time is the time required for an input executed at one of the CPM1/CPM1As to be output to the other CPM1/CPM1A by means of one-to-one link communications.

The minimum and maximum I/O response times are shown here, using as an example the following instructions executed at the master and the slave. In this example, communications proceed from the master to the slave.

The following conditions are taken as examples for calculating the I/O response times. In CPM1/CPM1A PCs, LR area words LR 00 to LR 15 are used in one-to-one links and the transmission time is fixed at 12 ms.

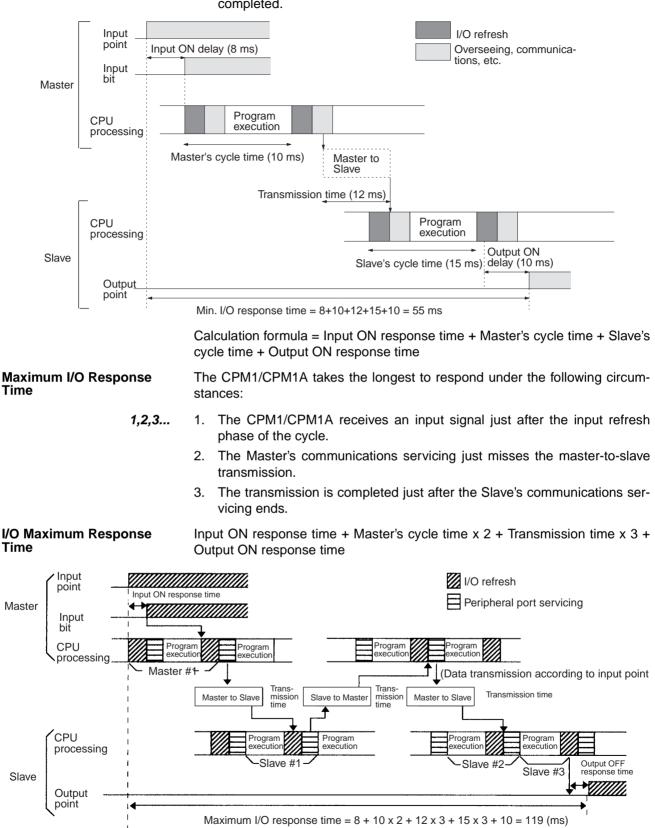

Input ON delay:	8 ms (input time constant: default setting)
Master cycle time:	10 ms
Slave cycle time:	15 ms
Output ON delay:	10 ms
Peripheral port:	Not used.

Minimum I/O Response Time

The CPM1/CPM1A responds most quickly under the following circumstances:

- **1,2,3...** 1. The CPM1/CPM1A receives an input signal just prior to the input refresh phase of the cycle.
 - 2. The Master's communications servicing occurs just as the master-to-slave transmission begins.

CPM1/CPM1A Cycle Time and I/O Response Time

Section 7-2

Section 7-2

7-2-5 Interrupt Processing Time

This section explains the processing times involved from the time an interrupt is executed until the interrupt processing routine is called, and from the time an interrupt processing routine is completed until returning to the initial location. This explanation applies to input interrupts, interval timer interrupts, and high-speed counter interrupts.

1,2,3... 1. Source of interrupt

- 2. Interrupt ON delay
- 3. Wait for completion of interrupt-mask processing
- 4. Change to interrupt processing
- 5. Interrupt routing (CPM1A only)
- 6. Return to initial location

The table below shows the times involved from the generation of an interrupt signal until the interrupt processing routine is called, and from when the interrupt processing routine is completed until returning to the original position.

ltem	Contents	Time
Interrupt ON delay	This is the delay time from the time the interrupt input bit turns ON until the time that the interrupt is executed. This is unrelated to other interrupts.	100 μs
Wait for completion of interrupt-mask processing	This is the time during which interrupts are waiting until processing has been completed. This situation occurs when a mask processes is executed. It is explained below in more detail.	See below.
Change to interrupt processing	This is the time it takes to change processing to an interrupt.	30 µs
Return	This is the time it takes, from execution of RET(93), to return to the process- ing that was interrupted.	30 µs

Mask Processing

Interrupts are masked during processing of the operations described below. Until the processing is completed, any interrupts will remain masked for the indicated times.

Generation and clearing of non-fatal errors:

When a non-fatal error is generated and the error contents are registered at the CPM1, or when an error is being cleared, interrupts will be masked for a maximum of 100 μ s until the processing has been completed.

Online editing:

Interrupts will be masked for a maximum of 600 ms (i.e.: editing DM 6144 to DM 6655) when online editing is executed during operation. In addition, the system processing may have to wait for a maximum of 170 μ s during this processing.

Example Calculation

This example shows the interrupt response time (i.e., the time from when the interrupt input turns ON until the start of the interrupt processing routine) when input interrupts are used under the conditions shown below.

Minimum Response Time

+	Interrupt ON delay: Interrupt mask standby time: Change-to-interrupt processing:	100 μs 0 μs 30 μs
	Minimum response time:	130 µs
	num Response Time ept for the Online Editing of DM 6144 to	DM6655)
	Interrupt ON delay:	$100 \ \mu s$
	Interrupt mask standby time:	170 µs
+	Change-to-interrupt processing:	30 µs
	Maximum response time:	300 µs

In addition to the response time shown above, the time required for executing the interrupt processing routine itself and a return time of $30 \ \mu s$ must also be accounted for when returning to the process that was interrupted.

7-2-6 CPM1/CPM1A Instruction Execution Times

The following table lists the execution times for CPM1/CPM1A instructions.

Basic Instructions

Code	Mnemonic	ON execution	Conditions (Top: min.; bottom: max.)	OFF execution time (µs)		
		time (μs)		RSET	IL	JMP
	LD LD NOT	1.72	Any			
 	AND AND NOT OR OR NOT	1.32				
	AND LD OR LD	0.72				
	OUT OUT NOT	4.0				
	SET	5.8				
	RSET	5.9				
	TIM	10.0	Constant for SV	16.2	16.0	6.4
			*DM for SV	31.4	31	6.4
	CNT	12.5	Constant for SV	14.1	6.2	6.6
			*DM for SV	29.1	6.2	6.6

Special Instructions

SRM1 Cycle Time and I/O Response Time

Code	Mnemonic	ON execution time (μs)	Conditions (Top: min.; bottom: max.)	OFF execution time (µs)
97	IORF	40.0	Refreshing IR 000	6.0
		142.6	Refreshing one input word	
		135.4	Refreshing one output word	
99	MCRO	74.0	With word-set I/O operands	5.6
		116.4	With *DM-set I/O operands	

7-3 SRM1 Cycle Time and I/O Response Time

7-3-1 The SRM1 Cycle

The overall flow of SRM1 operation is as shown in the following flowchart.

Note

- 1. The cycle time can be read using Peripheral Devices.
 - 2. Cycle time maximum and current cycle time are stored in AR 14 and AR 15.

3. Change to processing will cause cycle times to change therefore the calculated values and actual values (for cycle time) will no always match.

7-3-2 SRM1 Cycle Time

The processes involved in a single SRM1 cycle are shown in the following table, and their respective processing times are explained.

Process	Content	Time requirements
Overseeing	Setting cycle watchdog timer, UM check, refreshing bits allocated to new functions, etc.	0.18 ms
CompoBus/S end wait	Waiting for CompoBus/S processing to finish	CompoBus/S communications response time – Overseeing time – RS-232C port servicing time – periph- eral port servicing time
Input refreshing	Input information is read to input bits.	0.02 ms
Program execution	User program is executed. Refer to 7-3-6 SRM1 Instruction Execution Times.	Total time for executing instructions. (Varies according to content of user's program.)
Cycle time calculation	Standby until set time, when minimum cycle time is set in DM 6619 of PC Setup.	Almost instantaneous, except for standby processing.
	Calculation of cycle time.	
Output refreshing	Output information (results of executing program) is written to output bits.	0.05 ms
	CompoBus/S communications are started.	
RS-232C port servicing	Devices connected to RS-232C port serviced.	5% or less of cycle time, but always between 0.55 and 131 ms (Set in DM 6616)
Peripheral port servicing	Devices connected to peripheral port serviced.	5% or less of cycle time, but always between 0.55 and 131 ms (Set in DM 6617)

Minimum Cycle Time

In SRM1 PCs, CompoBus/S communications are started after the output refresh is completed. As a result, when the overseeing time plus the RS-232C port servicing time plus the peripheral port servicing time is shorter than the CompoBus/S communications response time, processing is placed on standby until CompoBus/S communications are completed.

The minimum cycle time therefore is the the CompoBus/S communications response time plus the program execution time plus the input refresh time plus the output refresh time. The CompoBus/S communications response time depends on the maximum number of nodes set, as follows:

Max. no. of nodes set	CompoBus/S response time
32	0.8 ms
16	0.5 ms

Cycle Time and Operations The effects of the cycle time on SRM1 operations are as shown below. When a long cycle time is affecting operation, either reduce the cycle time or improve responsiveness with interrupt programs.

Cycle time	Operation conditions
10 ms or longer	TIMH(15) may be inaccurate when TC 004 through TC 127 are used (operation will be normal for TC 000 through TC 003).
20 ms or longer	Programming using the 0.02-second Clock Bit (SR 25401) may be inaccurate.
100 ms or longer	TIM may be inaccurate. Programming using the 0.1-second Clock Bit (SR 25500) may be inaccurate. A CYCLE TIME OVER error is generated (SR 25309 will turn ON). See note 1.
120 ms or longer	The FALS 9F monitoring time SV is exceeded. A system error (FALS 9F) is generated, and operation stops. See note 2.
200 ms or longer	Programming using the 0.2-second Clock Bit (SR 25501) may be inaccurate.

- Note 1. The PC Setup (DM 6655) can be used to disable detection of CYCLE TIME OVER error.
 - 2. The cycle monitoring time can be changed in the PC Setup (DM 6618).

Cycle Time Example

The following is an example of a cycle time calculation. The operating conditions are assumed to be as follows:

User's program:500 instructions (consists of only LD and OUT)

Cycle time: Variable (no minimum set)

RS-232C port: Not used.

Max. nodes: 32 (CompoBus/S communication response time = 0.8 ms) Peripheral: 0.7 ms

The average processing time for a single instruction in the user's program is assumed to be $1.16 \ \mu$ s. The cycle times are as shown in the following table.

Process	Calculation method	Peripheral port used	Peripheral port not used
1. Overseeing	Fixed	0.18 ms	0.18 ms
2. CompoBus/S end wait	See previous page.	0.00 ms	0.62 ms
3. Input refresh	Fixed	0.02 ms	0.02 ms
4. Program execution	1.16 × 500 (μs)	0.8 ms	0.8 ms
5. Cycle time calculation	Negligible	0.00 ms	0.00 ms
6. Output refresh	$0.01 \times 1 + 0.005 \times 1 \ (\mu s)$	0.05 ms	0.05 ms
7. RS-232C port servicing	Not required	0.00 ms	0.00 ms
8. Peripheral port servicing	5% of cycle time	0.7 ms	0.00 ms
Cycle time	(1) + (2) + (3) ++ (8)	1.75 ms	1.67 ms

Note

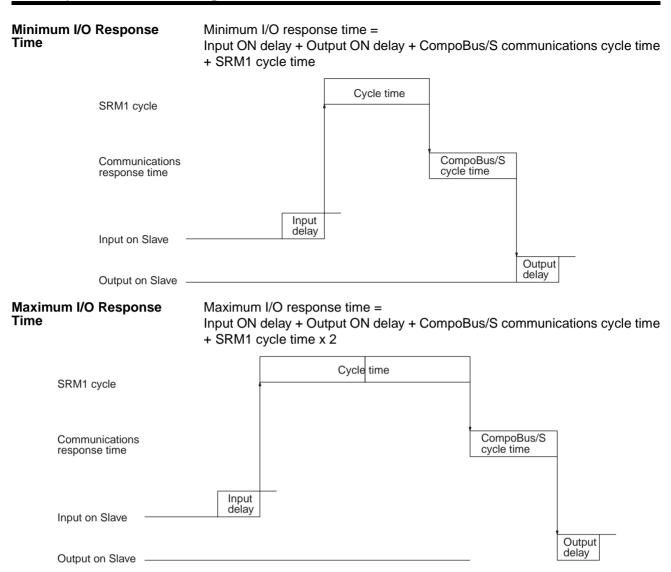

- **1**. The cycle time can be read from the PC via a Peripheral Device.
 - 2. The maximum and current cycle time are stored in AR 14 and AR 15.
 - 3. The cycle time can vary with actual operating conditions and will not necessarily agree precisely with the calculated value.
 - 4. When the peripheral port is used, there is no CompoBus/S end wait time as it is always 0 or less.
 - CompoBus/S end wait time = 0.8 0.18 0 0 = 0.62 (CompoBus/S communication response time Overseeing RS-232C port servicing time peripheral port servicing time.

7-3-3 I/O Response Time

The I/O response time is the time it takes after an input signal has been received (i.e., after an input bit has turned ON) for the PC to check and process the information and to output a control signal (i.e., to output the result of the processing to an output bit).

CompoBus/S communications are started when the SRM1 input refresh finishes. The ON/OFF status is read from the Input Terminals during the input refresh and the ON/OFF status is output to the Output Terminal during the output refresh. Accordingly, the SRM1 I/O response time varies according to the cycle time and CompoBus/S communications cycle status or I/O timing.

Example calculations of the I/O response time are provided next.

One-to-one Link I/O Response Time 7-3-4

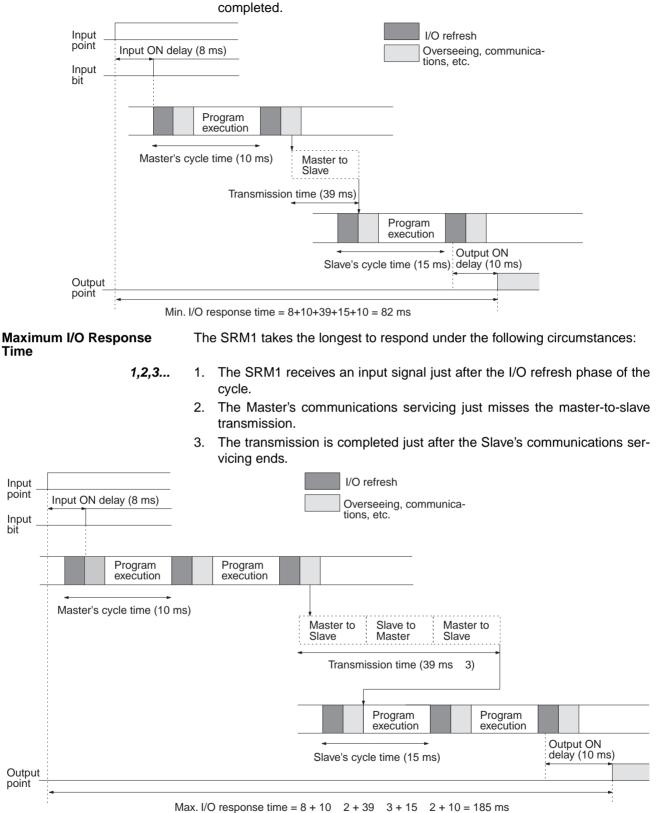

When two SRM1s are linked one-to-one, the I/O response time is the time required for an input executed at one of the SRM1s to be output to the other SRM1 by means of one-to-one link communications.

Minimum I/O Response Time

1,2,3...

The SRM1 responds most quickly under the following circumstances:

- 1. The SRM1 receives an input signal just prior to the I/O refresh phase of the cycle. 2.
 - The Master's communications servicing occurs just as the master-to-slave transmission begins.

7-3-5 Interrupt Processing Time

This section explains the processing times involved from the time an interrupt is executed until the interrupt processing routine is called, and from the time an interrupt processing routine is completed until returning to the initial location. This explanation applies to input, interval timer interrupts.

- 1,2,3... 1. Source of interrupt
 - 2. Wait for completion of interrupt-mask processing
 - 3. Change to interrupt processing
 - 4. Interrupt routing (CPM1A only)
 - 5. Return to initial location

The table below shows the times involved from the generation of an interrupt signal until the interrupt processing routine is called, and from when the interrupt processing routine is completed until returning to the original position.

Item	Contents	Time
Wait for completion of interrupt-mask processing	This is the time during which interrupts are waiting until processing has been completed. This situation occurs when a mask processes is executed. It is explained below in more detail.	See below.
Change to interrupt processing	This is the time it takes to change processing to an interrupt.	15 μs
Return	This is the time it takes, from execution of RET(93), to return to the process- ing that was interrupted.	15 μs

Mask Processing

Interrupts are masked during processing of the operations described below. Until the processing is completed, any interrupts will remain masked for the indicated times.

Generation and clearing of non-fatal errors:

When a non-fatal error is generated and the error contents are registered at the SRM1, or when an error is being cleared, interrupts will be masked for a maximum of 100 μ s until the processing has been completed.

Online editing:

Interrupts will be masked for a maximum of 600 ms (i.e.: editing DM 6144 to DM 6655) when online editing is executed during operation. In addition, the system processing may have to wait for a maximum of 170 μs during this processing.

7-3-6 SRM1 Instruction Execution Times

The following table lists the execution times for SRM1 instructions.

Basic Instructions

Code	Mnemonic	ON execution	Conditions (Top: min.; bottom: max.)	OFF ex	ecution ti	me (µ s)
		time (μs)		RSET	IL	JMP
	LD	0.97	Any			
	LD NOT	0.97				
	AND AND NOT	0.77				
	OR OR NOT	0.78	Any			
	AND LD OR LD	0.39	Any			
	OUT OUT NOT	2.2

		53.7	$*DM \rightarrow *DM$	
91	SBS	13.2	Any	3.0
92	SBN		1	1.3
93	RET	7.8	1	1.3
99	MCRO	26.8	With word-set I/O operands	3.0
		43.5	With *DM-set I/O operands	

Note Those instructions marked with an asterisk are expansion instructions.

Exchangeable Expansion Instructions

Code	Mnemonic	ON execution time (μs)	Conditions (Top: min.; bottom: max.)	OFF execution time (μ s)
	HEX	43.6	$DM \to DM$	3.0
		73.5	$*DM \rightarrow *DM$	
	FCS	23.4	Adding one word and outputting to word	3.0
		643.7	Adding 999 words and outputting to *DM	
	STUP	51.2	Transferring constant to word	3.0
		58.2	Transferring word to word	

SECTION 8 Troubleshooting

This section describes how to diagnose and correct the hardware and software errors that can occur during PC operation.

8-1	Introduction				
8-2	Programming Console Operation Errors.				
8-3	Program	ming Errors	435		
8-4	User-de	fined Errors	436		
8-5	Operation	ng Errors	437		
	8-5-1	Non-fatal Errors	437		
	8-5-2	Fatal Errors	439		
	8-5-3	Other Errors	440		
8-6	Error Lo	og	441		
8-7	Host Li	nk Errors	442		
8-8	Trouble	shooting Flowcharts	444		
	8-8-1	CPM1 Flowcharts	444		
	8-8-2	CPM1A Flowcharts	444		
	8-8-3	SRM1 Flowcharts	444		
	8-8-4 CQM1 Flowcharts. 4				

8-1 Introduction

PC errors can be divided broadly into the following four categories:

1,2,3... 1. Program Input Errors

These errors occur when inputting a program or attempting an operation used to prepare the PC for operation.

- Programming Errors
 These errors will occur when the program is checked using the Program Check operation.
- 3. User-defined Errors

There are three instructions that the user can use to define his own errors or messages. The instructions will be executed when a particular condition (defined by the user) has occurred during operation.

4. Operating Errors

These errors occur after program execution has been started.

- a) Non-fatal Operating Errors
 PC operation and program execution will continue after one or more of these errors have occurred.
- b) Fatal Operating Errors

PC operation and program execution will stop and all outputs from the PC will be turned OFF when any of these errors have occurred.

The PC's indicators will indicate when a PC error has occurred and an error message or code will be displayed on the Programming Console or host computer if one is connected. The error code is also contained in SR 25300 to SR 25307.

For the most recent errors, both the type of error and time of occurrence will be recorded in the PC's error log area. Details are provided starting on page 441.

There are flags and other information provided in the SR and AR areas that can be used in troubleshooting. Refer to *Section 3 Memory Areas* for lists of these.

Note In addition to the errors described above, communications errors can occur when the PC is part of a Host Link System. Refer to page 442 for details.

8-2 Programming Console Operation Errors

The following error messages may appear when performing operations on the Programming Console. Correct the error as indicated and continue with the operation. The asterisks in the displays shown below will be replaced with numeric data, normally an address, in the actual display. Refer to the *Ladder Support Software Operation Manual*, SYSMAC Support Software Operation Manual: C-series PCs, or Data Access Console Operation Manual for errors that may appear when operating the SSS or a Data Access Console.

Message	Meaning and appropriate response
REPL ROM	An attempt was made to write to write-protected memory.
	In CQM1 PCs, set the write-protect switch (pin 1 of the CPU Unit's DIP switch) to OFF. In CPM1/CPM1A/SRM1 PCs, set bits 00 to 03 of DM 6602 to "0."
PROG OVER	The instruction at the last address in memory is not NOP(00). Erase all unnecessary instructions at the end of the program.

Message	Meaning and appropriate response
ADDR OVER	An address was set that is larger than the highest memory address in Program Memory. Input a smaller address.
SET DATA ERR	FALS 00 has been input, and "00" cannot be input. Reinput the data.
I/O NO. ERR	A data area address has been designated that exceeds the limit of the data area, e.g., an address is too large. Confirm the requirements for the instruction and re-enter the address.

8-3 Programming Errors

These errors in program syntax will be detected when the program is checked using the Program Check operation.

Three levels of program checking are available. The desired level must be designated to indicate the type of errors that are to be detected. The following table provides the error types, displays, and explanations of all syntax errors. Check level 0 checks for type A, B, and C errors; check level 1, for type A and B errors; and check level 2, for type A errors only.

Level A Errors

Message	Meaning and appropriate response		
?????	The program has been damaged, creating a non-existent function code. Re-enter the program.		
CIRCUIT ERR	The number of logic blocks and logic block instructions does not agree, i.e., either LD or LD NOT has been used to start a logic block whose execution condition has not been used by another instruction, or a logic block instruction has been used that does not have the required number of logic blocks. Check your program.		
OPERAND ERR	A constant entered for the instruction is not within defined values. Change the constant so that it lies within the proper range.		
NO END INSTR	There is no END(01) in the program. Write END(01) at the final address in the program.		
LOCN ERR	An instruction is in the wrong place in the program. Check instruction requirements and correct the program.		
JME UNDEFD	A JME(04) instruction is missing for a JMP(05) instruction. Correct the jump number or insert the proper JME(04) instruction.		
DUPL	The same jump number or subroutine number has been used twice. Correct the program so that the same number is only used once for each.		
SBN UNDEFD	The SBS(91) instruction has been programmed for a subroutine num- ber that does not exist. Correct the subroutine number or program the required subroutine.		
STEP ERR	STEP(08) with a section number and STEP(08) without a section number have been used incorrectly. Check STEP(08) programming requirements and correct the program.		

Level B Errors

Message	Meaning and appropriate response	
IL-ILC ERR	IL(02) and ILC(03) are not used in pairs. Correct the program so that each IL(02) has a unique ILC(03). Although this error message will appear if more than one IL(02) is used with the same ILC(03), the program will be executed as written. Make sure your program is written as desired before proceeding.	
JMP-JME ERR	JMP(04) and JME(05) are not used in pairs. Make sure your program is written as desired before proceeding.	
SBN-RET ERR	If the displayed address is that of SBN(92), two different subroutines have been defined with the same subroutine number. Change one of the subroutine numbers or delete one of the subroutines. If the displayed address is that of RET(93), RET(93) has not been used properly. Check requirements for RET(93) and correct the program.	

Level C Errors

Message	Meaning and appropriate response
COIL DUPL	The same bit is being controlled (i.e., turned ON and/or OFF) by more than one instruction (e.g., OUT, OUT NOT, DIFU(13), DIFD(14), KEEP(11), SFT(10)). Although this is allowed for certain instructions, check instruction requirements to confirm that the program is correct or rewrite the program so that each bit is controlled by only one instruction.
JMP UNDEFD	JME(05) has been used with no JMP(04) with the same jump number. Add a JMP(04) with the same number or delete the JME(05) that is not being used.
SBS UNDEFD	A subroutine exists that is not called by SBS(91). Program a subrou- tine call in the proper place, or delete the subroutine if it is not required.

▲ Caution Expansion instructions (those assigned to function codes 17, 18, 19, 47, 48, 60 to 69, 87, 88, and 89) are not subject to program checks. Program checks also do not cover DM 1024 to DM 6143 for PCs that do not support this part of the DM area (e.g., CQM1-CPU11-E and CQM1-CPU21-E). Data will not be written even if these areas are specified and data read from these areas will always be "0000."

8-4 User-defined Errors

There are four instructions that the user can use to define his own errors or messages. These instructions are used to send messages to the Programming Console connected to the PC, cause a non-fatal or a fatal error.

MESSAGE – MSG(46) MSG(46) is used to display a message on the Programming Console. The message, which can be up to 16 characters long, is displayed when the instruction's execution condition is ON. Refer to page 325 for details.

FAILURE ALARM –
FAL(06)FAL(06) is an instruction that causes a non-fatal error. Refer to page 209 for
details. The following will occur when an FAL(06) instruction is executed:

- *1,2,3...* 1. The ERR/ALM indicator on the CPU Unit will flash. PC operation will continue.
 - 2. The instruction's 2-digit BCD FAL number (01 to 99) will be written to SR 25300 to SR 25307.
 - 3. The FAL number will be recorded in the PC's error log area. In CQM1 PCs, the time of occurrence will also be recorded if a Memory Cassette with a clock (RTC) is used.

	The FAL numbers can be set arbitrarily to indicate particular conditions. The same number cannot be used as both an FAL number and an FALS number. To clear an FAL error, correct the cause of the error, execute FAL 00, and then clear the error using the Programming Console.
SEVERE FAILURE ALARM – FALS(07)	FALS(07) is an instruction that causes a fatal error. Refer to page 209 for details. The following will occur when an FALS(07) instruction is executed:
1,2,3	 Program execution will be stopped and outputs will be turned OFF. The ERR/ALM indicator on the CPU Unit will be lit. The instruction's 2-digit BCD FALS number (01 to 99) will be written to SR 25300 to SR 25307. The FALS number will be recorded in the PC's error log area. In CQM1 PCs, the time of occurrence will also be recorded if a Memory Cassette with a clock (RTC) is used. The FALS numbers can be set arbitrarily to indicate particular conditions. The same number cannot be used as both an FAL number and an FALS number. To clear an FALS error, switch the PC to PROGRAM Mode, correct the cause of the error, and then clear the error using the Programming Console.
FAILURE POINT DETECT – FPD(—)	In CQM1 PCs, non-fatal errors and error messages can also be generated using FPD(—). Refer to page 330 for details.

8-5 Operating Errors

There are two kinds of operating errors, non-fatal and fatal. PC operation will continue after a non-fatal error occurs, but operation will be stopped if a fatal error occurs.

▲ Caution Investigate all errors, whether fatal or not. Remove the cause of the error as soon as possible and restart the PC. Refer to the *CQM1 Operation Manual* or *CPM1 Operation Manual* for hardware information and Programming Console operations related to errors. Refer to the *SSS Operation Manual* for SSS operations related to errors.

8-5-1 Non-fatal Errors

PC operation and program execution will continue after one or more of these errors have occurred. Although PC operation will continue, the cause of the error should be corrected and the error cleared as soon as possible.

When one of these errors occurs, the POWER and RUN indicators will remain lit and the ERR/ALM indicator will flash.

Operating Errors

CQM1 Non-fatal Errors

Message	FAL No.	Meaning and appropriate response
SYS FAIL FAL** (see note)	01 to 99	An FAL(06) instruction has been executed in the program. Check the FAL number to determine conditions that would cause execution, correct the cause, and clear the error.
	9D	An error has occurred during data transmission between the CPU Unit and Memory Cassette. Check the status of flags AR 1412 to AR 1415, and correct as directed.
		AR 1412 ON: Switch to PROGRAM Mode, clear the error, and transfer again.
		AR 1413 ON: The transfer destination is write-protected.
		If the PC is the destination, turn off the power to the PC, be sure that pin 1 of the CPU Unit's DIP switch is OFF, clear the error, and transfer again.
		If an EEPROM Memory Cassette is the destination, check whether the power supply is on, clear the error, and transfer again.
		If an EPROM Memory Cassette is the destination, change to a writeable Memory Cassette.
		AR 1414 ON: The destination has insufficient capacity. Check the source's program size in AR 15 and consider using a different CPU Unit or Memory Cassette.
		AR 1415 ON: There is no program in the Memory Cassette or the program contains errors. Check the Memory Cassette.
	9C	An error has occurred in the pulse I/O function or in the absolute-type encoder interface function. Check the contents of AR 0408 to AR 0415 (two digits BCD), and correct as directed. (This error code applies only to CQM1-CPU43-EV1 and CQM1-CPU44-EV1 CPU Units.)
		01, 02: An error has occurred in the hardware. Turn the power off, and then power up again. If the error persists, replace the CPU Unit.
		03: The PC Setup (DM 6611, DM 6612, DM 6643, DM 6644) settings are incorrect. Correct the settings.
		04: CQM1 operation was interrupted during pulse output. Check to see whether the Unit receiving the pulse output was affected.
SYS FAIL FAL** (see note)	9B	An error has been detected in the PC Setup. Check flags AR 2400 to AR 2402, and correct as directed.
		AR 2400 ON: An incorrect setting was detected in the PC Setup (DM 6600 to DM 6614) when power was turned on. Correct the settings in PROGRAM Mode and turn on the power again.
		AR 2401 ON: An incorrect setting was detected in the PC Setup (DM 6615 to DM 6644) when switching to RUN Mode. Correct the settings in PROGRAM Mode and switch to RUN Mode again.
		AR 2402 ON: An incorrect setting was detected in the PC Setup (DM 6645 to DM 6655) during operation. Correct the settings and clear the error.
SCAN TIME OVER	F8	Watchdog timer has exceeded 100 ms. (SR 25309 will be ON.)
		This indicates that the program cycle time is longer than recommended. Reduce cycle time if possible.
BATT LOW	F7	Backup battery is missing or its voltage has dropped. (SR 25308 will be ON.)
		Check the battery and replace if necessary. Check the PC Setup (DM 6655) to see whether a low battery will be detected.

Note ** is 01 to 99, 9D, 9C, or 9B.

Communication Errors

If an error occurs in communications through the peripheral port or RS-232C port the corresponding indicator (COM1 or COM2) will stop flashing. Check the connecting cables as well as the programs in the PC and host computer.

Reset the communications ports with the Port Reset Bits, SR 25208 and SR 25209.

Output Inhibit

When the OUT INH indicator is lit, the Output Inhibit Bit (SR 25215) is ON and all outputs from the CPU Unit will be turned off. If it is not necessary to have all outputs off, turn OFF SR 25215.

CPM1/CPM1A/SRM1 Non-fatal Errors

Message	FAL No.	Meaning and appropriate response
SYS FAIL FAL** (see note)	01 to 99	An FAL(06) instruction has been executed in the program. Check the FAL number to determine conditions that would cause execution, correct the cause, and clear the error.
	9B	An error has been detected in the PC Setup. Check flags AR 1300 to AR 1302, and correct as directed.
		AR 1300 ON: An incorrect setting was detected in the PC Setup (DM 6600 to DM 6614) when power was turned on. Correct the settings in PROGRAM Mode and turn on the power again.
		AR 1301 ON: An incorrect setting was detected in the PC Setup (DM 6615 to DM 6644) when switching to RUN Mode. Correct the settings in PROGRAM Mode and switch to RUN Mode again.
		AR 1302 ON: An incorrect setting was detected in the PC Setup (DM 6645 to DM 6655) during operation. Correct the settings and clear the error.
SCAN TIME OVER	F8	Watchdog timer has exceeded 100 ms. (SR 25309 will be ON.)
		This indicates that the program cycle time is longer than recommended. Reduce cycle time if possible. (The CPM1/CPM1A/SRM1 can be set so that this error won't be detected.)
Communication Errors (no message)	None	If an error occurs in communications through the peripheral port or RS-232C port, the COMM indicator will be off. The error flag in AR0812 will be ON. Check the connecting cables and restart.

Note ** is 01 to 99 or 9B.

8-5-2 Fatal Errors

PC operation and program execution will stop and all outputs from the PC will be turned OFF when any of these errors have occurred.

All CPU Unit indicators will be OFF for the power interruption error. For all other fatal operating errors, the POWER and ERR/ALM indicators will be lit. The RUN indicator will be OFF.

CQM1 Fatal Errors

Message	FALS No.	Meaning and appropriate response
Power interruption (no message)	None	Power has been interrupted for at least 10 ms. Check power supply voltage and power lines. Try to power-up again.
MEMORY ERR	F1	AR 1611 ON: A checksum error has occurred in the PC Setup (DM 6600 to DM 6655). Initialize all of the PC Setup and reinput.
		AR 1612 ON: A checksum error has occurred in the program, indicating an incorrect instruction. Check the program and correct any errors detected.
		AR 1613 ON: A checksum error has occurred in an expansion instruction's data. Initial- ize all of the expansion instruction settings and reinput.
		AR 1614 ON: Memory Cassette was installed or removed with the power on. Turn the power off, install the Memory Cassette, and turn the power on again.
		AR 1615 ON: The Memory Cassette contents could not be read at start-up. Check flags AR 1412 to AR 1415 to determine the problem, correct it, and turn on the power again.
NO END INST	F0	END(01) is not written anywhere in program. Write END(01) at the final address of the program.
I/O BUS ERR	C0	An error has occurred during data transfer between the CPU Unit and an I/O Unit. Determine the location of the problem using flags AR 2408 to AR 2415, turn the power off, check for loose I/O Units or end covers, and turn on the power again.
I/O UNIT OVER	E1	The number of I/O words on the installed I/O Units exceeds the maximum. Turn off the power, rearrange the system to reduce the number of I/O words, and turn on the power again.

Operating Errors

Message	FALS No.	Meaning and appropriate response
SYS FAIL FALS** (see note)	01 to 99	An FALS(07) instruction has been executed in the program. Check the FALS number to determine the conditions that would cause execution, correct the cause, and clear the error.
	9F	The cycle time has exceeded the FALS 9F Cycle Time Monitoring Time (DM 6618). Check the cycle time and adjust the Cycle Time Monitoring Time if necessary.

Note ** is 01 to 99 or 9F.

CPM1/CPM1A/SRM1 Fatal Errors

Message	FALS No.	Meaning and appropriate response
Power interruption (no message)	None	Power has been interrupted for at least 10 ms. Check power supply voltage and power lines. Try to power-up again.
MEMORY ERR	F1	AR 1308 ON: An unspecified bit area exists in the user program. Check the program and correct errors.
		AR 1309 ON: An error has occurred in the flash memory. Since the number of writings to the flash memory has exceeded the specified level, replace the CPU Unit.
		AR 1310 ON: A checksum error has occurred in read-only DM (DM 6144 to DM 6599). Check and correct the settings in the read-only DM area.
		AR 1311 ON: A checksum error has occurred in the PC Setup. Initialize all of the PC Setup and reinput.
		AR 1312 ON: A checksum error has occurred in the program. Check the program and correct any errors detected.
		AR 1314 ON: Power interruption hold area was not held. Clear the error and reset the settings of the power interruption hold area.
		AR 1315 ON: An error has occurred in CompoBus/S communications. If the error cannot be corrected, replace the CPU Unit (SRM! only).
NO END INST	F0	END(01) is not written in the program. Write END(01) at the end of the program.
I/O BUS ERR (see note 1) C0 An error has occurred during data transfer between the CPU Unit and I/O Unit the I/O Unit's connecting cable.		An error has occurred during data transfer between the CPU Unit and I/O Unit. Check the I/O Unit's connecting cable.
I/O UNIT OVER (see note 1)		
SYS FAIL FALS** (see note 2)	01 to 99	A FALS(07) instruction has been executed in the program. Check the FALS number to determine the conditions that caused execution, correct the cause, and clear the error.
	9F	The cycle time has exceeded the FALS 9F Cycle Time Monitoring Time (DM 6618). Check the cycle time and adjust the Cycle Time Monitoring Time if necessary.

Note 1. CPM1/CPM1A only.

2. ** is 01 to 99 or 9F.

8-5-3 Other Errors

The PWR indicator will be ON for the following errors. Ignore the status of other indicators unless a specific status is given in the following table.

Error status	FALS No.	Meaning and appropriate response
CompoBus/S com- munications error	None	The ERC indicator will light to indicate an error in CompoBus/S communications. Check the slaves and the transmission path and restart the system.
Peripheral/RS-232C port communica- tions error	None	The COMM indicator will light and AR 0812 will turn ON to indicate an error between the peripheral or RS-232C port and the Peripheral Device.

CPM1/CPM1A/SRM1 Fatal Errors

8-6 Error Log

The error log function registers the error code of any fatal or non-fatal error that occurs in the PC. The date and time at which the error occurred are registered along with the error code. Refer to page 437 for error codes.

CQM1 Error Log Area

In CQM1 PCs, the error log is stored in DM 6569 through DM 6599.

If a Memory Cassette without a clock is mounted, the date and time will be all zeros.

Shows the number of error information items (0 to 7) stored in the Error log pointer error log. "0" means that there are no items stored. DM6569 DM6570 Error log record 0 Each error log record is configured as follows: DM6571 (3 words used.) 0 15 8 7 DM6572 Error classification Error code Leading word Leading word + 1 Min Sec Each stored in 2 digits BCD. Leading word + 2 to Day Hour Error classification: 00: Nonfatal 80: Fatal DM6597 Error log record 9 (3 words used.) DM6598 DM6599

Error records will be stored even if pin 1 on the CQM1 DIP switch is turned ON to protect DM 6144 to DM 6655.

CPM1/CPM1A Error Log Area

DM1000 Error log pointer
DM1001 Error log record 0
DM1002 DM1003
to
DM1019 Error log record 9
DM1019 DM1020
DM1021

In CPM1/CPM1A PCs, the error log is stored in DM 1000 through DM 1021.

The location for storing the next error record is shown. (0 to 6)
 Each error log record is configured as follows:

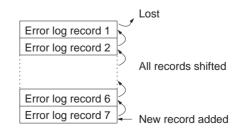

• •			
Bit	15 8	7	0
Leading word	Error classification	Error code	
Leading word + 1	00	00	
Leading word + 2	00	00	
Error classification: 00: Nonfatal			

80: Fatal

Error Log Storage Methods

The error log storage method is set in the PC Setup (DM 6655). Set any of the following methods.

1,2,3... 1. You can store the most recent 10 error log records and discard older records. This is achieved by shifting the records as shown below so that the oldest record (record 0) is lost whenever a new record is generated.

2. You can store only the first 10 error log records, and ignore any subsequent errors beyond those 10.

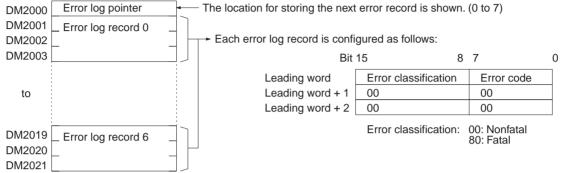

3. You can disable the log so that no records are stored.

The default setting is the first method. Refer to *Error Log Settings* on page 21 for details on the PC Setup for the error log.

Clearing the Error Log To clear the entire error log, turn ON SR 25214 from a peripheral device. (After the error log has been cleared, SR 25214 will turn OFF again automatically.)

SRM1 Error Log Area

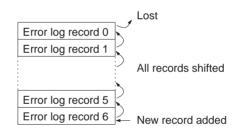

In SRM1 PCs, the error log is stored in DM 2000 through DM 2021.

Error Log Storage Methods

The error log storage method is set in the PC Setup (DM 6655). Set any of the following methods.

1,2,3... 1. You can store the most recent 7 error log records and discard older records. This is achieved by shifting the records as shown below so that the oldest record (record 0) is lost whenever a new record is generated.

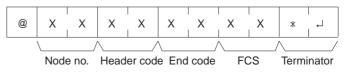

- 2. You can store only the first 7 error log records, and ignore any subsequent errors beyond those 7.
- 3. You can disable the log so that no records are stored.

The default setting is the first method. Refer to *Error Log Settings* on page 21 for details on the PC Setup for the error log.

Clearing the Error Log To clear the entire error log, turn ON SR 25214 from a peripheral device. (After the error log has been cleared, SR 25214 will turn OFF again automatically.)

8-7 Host Link Errors

These error codes are received as the response code (end code) when a command received by the PC from a host computer cannot be processed. The error code format is as shown below.

DN DN

The header code will vary according to the command. Some commands (composite commands) contain a subcode.

End code	Contents	Probable cause	Corrective measures
00	Normal completion		
01	Not executable in RUN mode	The command that was sent cannot be executed when the PC is in RUN mode.	Check the relation between the com- mand and the PC mode.
02	Not executable in MONITOR mode	The command that was sent cannot be executed when the PC is in MONITOR mode.	r
04	Address over (CPM1/CPM1A/ SRM1 PCs)	The user program area's highest address was exceeded.	Check the program.
0B	Not executable in PROGRAM mode	The command that was sent cannot be executed when the PC is in PROGRAM mode.	This code is not presently being used.
13	FCS error	The FCS is wrong. Either the FCS cal- culation is mistaken or there is adverse influence from noise.	Check the FCS calculation method. If there was influence from noise, transfer the command again.
14	Format error	The command format is wrong.	Check the format and transfer the com- mand again.
15	Entry number data error	The areas for reading and writing are wrong.	Correct the areas and transfer the com- mand again.
16	Command not supported	The specified command does not exist in the specified address. (Reading the SV, etc.)	Check the address and instruction.
18	Frame length error	The maximum frame length was exceeded.	Divide the command into multiple frames.
19	Not executable	Items to read not registered for com- posite command (QQ).	Execute QQ to register items to read before attempting batch read.
23	User memory write-protected	CQM1 PCs: Pin 1 on the CQM1 DIP	CQM1 PCs: Turn OFF pin 1.
		switch is ON. CPM1/CPM1A/SRM1 PCs: The mem- ory is write-protected in the PC Setup.	CPM1/CPM1A/SRM1 PCs: Change the setting in the PC Setup (DM 6602).
A3	Aborted due to FCS error in transmit data	The error was generated while a com- mand extending over more than one frame was being executed. Note: The data up to that point has already been written to the appropriate area of the CPU Unit.	Check for corrupted frames, correct if necessary, and try the transfer again.
A4	Aborted due to format error in transmit data		
A5	Aborted due to entry number data error in transmit data		
A8	Aborted due to frame length error in transmit data		
Other		Influence from noise was received.	Transfer the command again.

Power Interruptions

The following responses may be received from the CQM1 if a power interruption occurs, including momentary interruptions. If any of these responses are received during or after a power interruption, repeat the command.

Undefined Command Response

@00IC4A*പ

No Response

If no response is received, abort the last command and resend.

8-8 Troubleshooting Flowcharts

8-8-1 CPM1 Flowcharts

Refer to 5-6 Troubleshooting Flowcharts in the CPM1 Operation Manual.

8-8-2 CPM1A Flowcharts

Refer to 5-6 Troubleshooting Flowcharts in the CPM1A Operation Manual.

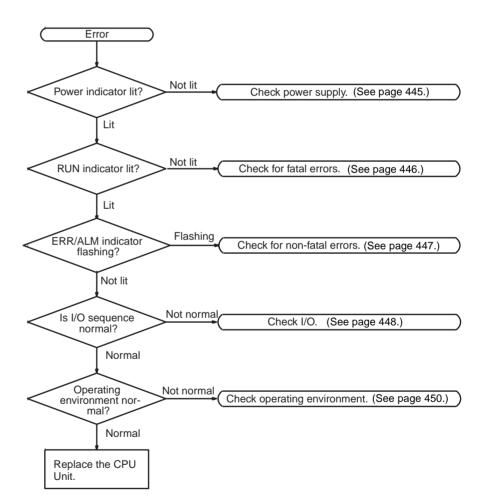

8-8-3 SRM1 Flowcharts

Refer to 5-6 Troubleshooting Flowcharts in the SRM1 Operation Manual.

8-8-4 CQM1 Flowcharts

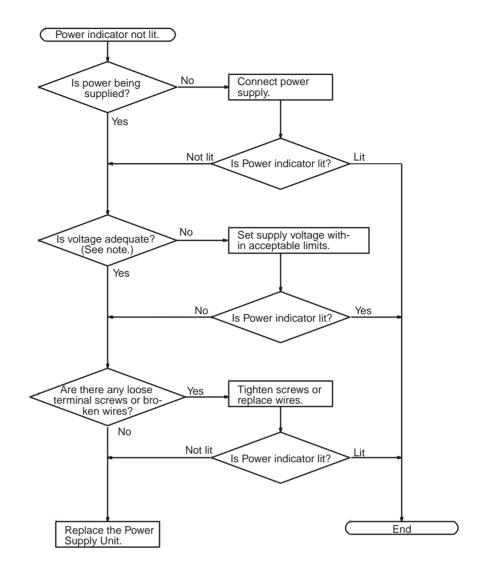

Use the following flowcharts to troubleshoot errors that occur during CQM1 operation.

Main Check

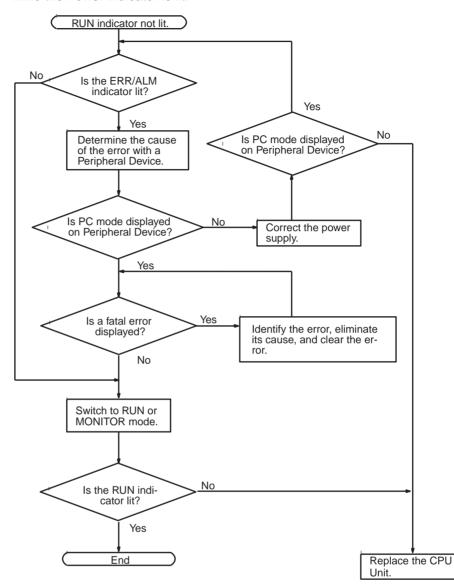

Note Always turn off the power to the PC before replacing Units, batteries, wiring, or cables.

Power Supply Check

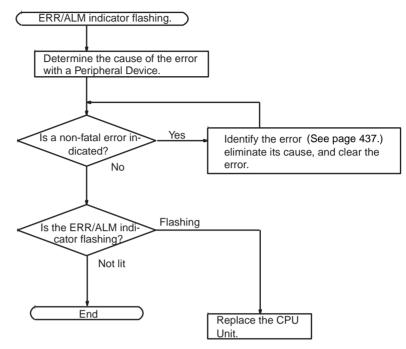

NoteThe allowable voltage ranges for the CQM1 are as shown below.
CQM1-PA203/PA206:85 to 264 VAC
20 to 28 VDC

The following flowchart can be used to troubleshoot fatal errors that occur while the Power indicator is lit.

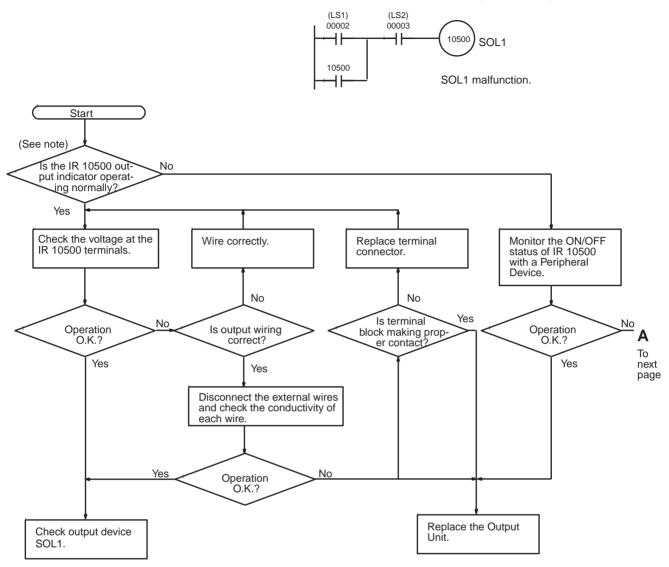

Non-fatal Error Check

Although the PC will continue operating during non-fatal errors, the cause of the error should be determined and removed as quickly as possible to ensure proper operation. It may to necessary to stop PC operation to remove certain non-fatal errors.

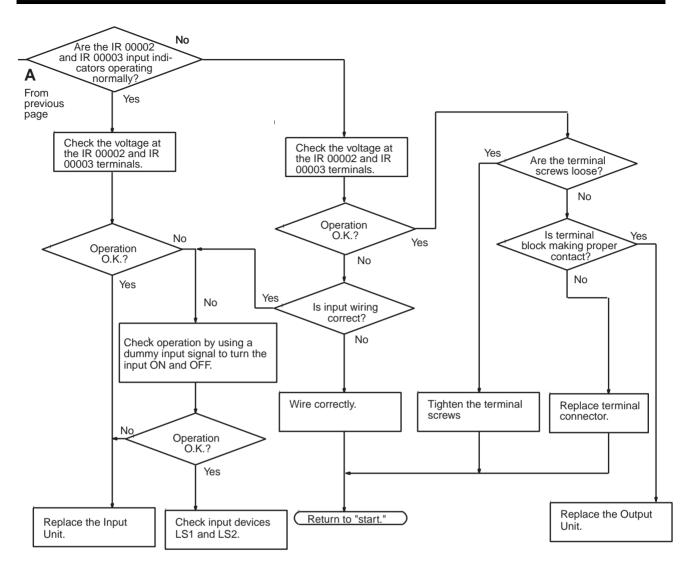

The I/O check flowchart is based on the following ladder diagram section.

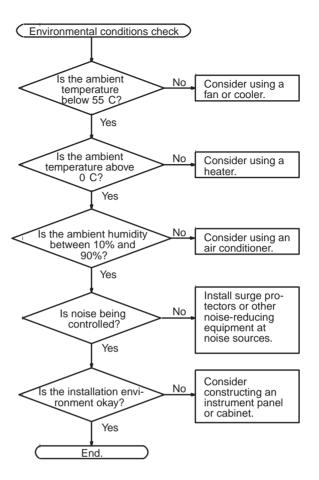

Note The CPM1 PC doesn't have the IR 10500 output indicator. Substitute with one from IR 01000 to IR 01915.

Troubleshooting Flowcharts

Environmental Conditions Check

Appendix A Programming Instructions

A PC instruction is input either by pressing the corresponding Programming Console key(s) (e.g., LD, AND, OR, NOT) or by using function codes. To input an instruction with its function code, press FUN, the function code, and then WRITE. Refer to the pages listed programming and instruction details.

Code	Mnemonic	Name	Function	Page	
	AND	AND	Logically ANDs status of designated bit with execution condi- tion.		
_	AND LD	AND LOAD	Logically ANDs results of preceding blocks.	201	
	AND NOT	AND NOT	Logically ANDs inverse of designated bit with execution condi- tion.	200	
	CNT	COUNTER	A decrementing counter.	214	
_	LD	LOAD	Used to start instruction line with the status of the designated bit or to define a logic block for use with AND LD and OR LD.	200	
_	LD NOT	LOAD NOT	Used to start instruction line with inverse of designated bit.	200	
—	OR	OR	Logically ORs status of designated bit with execution condi- tion.	200	
_	OR LD	OR LOAD	Logically ORs results of preceding blocks.	201	
	OR NOT	OR NOT	Logically ORs inverse of designated bit with execution condi- tion.	200	
_	OUT	OUTPUT	Turns ON operand bit for ON execution condition; turns OFF operand bit for OFF execution condition.	201	
	OUT NOT	OUTPUT NOT	Turns operand bit OFF for ON execution condition; turns oper- and bit ON for OFF execution condition (i.e., inverts opera- tion).	201	
	RSET	RESET	Turns the operand bit OFF when the execution condition is ON, and does not affect the status of the operand bit when the execution condition is OFF.	202	
_	SET	SET	Turns the operand bit ON when the execution condition is ON, and does not affect the status of the operand bit when the exe- cution condition is OFF.	202	
_	TIM	TIMER	ON-delay (decrementing) timer operation.	213	
00	NOP	NO OPERATION	Nothing is executed and program moves to next instruction.	205	
01	END	END	Required at the end of the program.	205	
02	IL	INTERLOCK	If interlock condition is OFF, all outputs are turned OFF and all timer PVs reset between this IL(02) and the next ILC(03).	205	
03	ILC	INTERLOCK CLEAR	Other instructions are treated as NOP; counter PVs are main- tained.	205	
04	JMP	JUMP	If jump condition is OFF, all instructions between JMP(04) and	207	
05	JME	JUMP END	the corresponding JME(05) are ignored.	207	
06	(@)FAL	FAILURE ALARM AND RESET	Generates a non-fatal error and outputs the designated FAL number to the Programming Console.	209	
07	FALS	SEVERE FAILURE ALARM	Generates a fatal error and outputs the designated FALS num- ber to the Programming Console.		
08	STEP	STEP DEFINE	When used with a control bit, defines the start of a new step and resets the previous step. When used without N, defines the end of step execution.		
09	SNXT	STEP START	Used with a control bit to indicate the end of the step, reset the step, and start the next step.		
10	SFT	SHIFT REGISTER	Creates a bit shift register.	229	
11	KEEP	KEEP	Defines a bit as a latch controlled by set and reset inputs.	203	

Code	Mnemonic	Name	Function	Page	
12	CNTR	REVERSIBLE COUNTER	Increases or decreases PV by one whenever the increment input or decrement input signals, respectively, go from OFF to ON.	216	
13	DIFU	DIFFERENTIATE UP	Turns ON the designated bit for one cycle on the rising edge of the input signal.	204	
14	DIFD	DIFFERENTIATE DOWN	Turns ON the bit for one cycle on the trailing edge.	217	
15	TIMH	HIGH-SPEED TIMER	A high-speed, ON-delay (decrementing) timer.	217	
16	(@)WSFT	WORD SHIFT	Shifts data between starting and ending words in word units, writing zeros into starting word.	230	
17 to 19	For expansion	on instructions.		118	
20	CMP	COMPARE	Compares the contents of two words and outputs result to GR, EQ, and LE Flags.	248	
21	(@)MOV	MOVE	Copies source data (word or constant) to destination word.	237	
22	(@)MVN	MOVE NOT	Inverts source data (word or constant) and then copies it to destination word.	238	
23	(@)BIN	BCD TO BINARY	Converts four-digit, BCD data in source word into 16-bit binary data, and outputs converted data to result word.	258	
24	(@)BCD	BINARY TO BCD	Converts binary data in source word into BCD, and outputs converted data to result word.	259	
25	(@)ASL	ARITHMETIC SHIFT LEFT	Shifts each bit in single word of data one bit to left, with CY.	230	
26	(@)ASR	ARITHMETIC SHIFT RIGHT	Shifts each bit in single word of data one bit to right, with CY.	231	
27	(@)ROL	ROTATE LEFT	Rotates bits in single word of data one bit to left, with CY.	231	
28	(@)ROR	ROTATE RIGHT	Rotates bits in single word of data one bit to right, with CY.	232	
29	(@)COM	COMPLEMENT	Inverts bit status of one word of data.	316	
30	(@)ADD	BCD ADD	Adds two four-digit BCD values and content of CY, and outputs result to specified result word.	285	
31	(@)SUB	BCD SUBTRACT	Subtracts a four-digit BCD value and CY from another four- digit BCD value and outputs result to the result word.	286	
32	(@)MUL	BCD MULTIPLY	Multiplies two four-digit BCD values and outputs result to specified result words.	288	
33	(@)DIV	BCD DIVIDE	Divides four-digit BCD dividend by four-digit BCD divisor and outputs result to specified result words.	289	
34	(@)ANDW	LOGICAL AND	Logically ANDs two 16-bit input words and sets corresponding bit in result word if corresponding bits in input words are both ON.	316	
35	(@)ORW	LOGICAL OR	Logically ORs two 16-bit input words and sets corresponding bit in result word if one or both of corresponding bits in input data are ON.	317	
36	(@)XORW	EXCLUSIVE OR	Exclusively ORs two 16-bit input words and sets bit in result word when corresponding bits in input words differ in status.	318	
37	(@)XNRW	EXCLUSIVE NOR	Exclusively NORs two 16-bit input words and sets bit in result word when corresponding bits in input words are same in sta- tus.		
38	(@)INC	BCD INCREMENT	Increments four-digit BCD word by one.	319	
39	(@)DEC	BCD DECREMENT	Decrements four-digit BCD word by one.	319	
40	(@)STC	SET CARRY	Sets carry flag (i.e., turns CY ON).	285	
41	(@)CLC	CLEAR CARRY	Clears carry flag (i.e, turns CY OFF).	285	
45	TRSM	TRACE MEMORY SAMPLE	Initiates data tracing. Cannot be used with CQM1-CPU11/21-E/CPM1/CPM1A / SRM1.		
46	(@)MSG	MESSAGE	Displays a 16-character message on the Programming Con- sole display.	325	
	4				

Code	Mnemonic	Name	Function	Page	
47 & 48	For expansion	on instructions.	·	118	
50	(@)ADB	BINARY ADD	Adds two four-digit hexadecimal values and content of CY, and outputs result to specified result word.	296	
51	(@)SBB	BINARY SUBTRACT	Subtracts a four-digit hexadecimal value and CY from another four-digit hexadecimal value and outputs result to the result word.	297	
52	(@)MLB	BINARY MULTIPLY	Multiplies two four-digit hexadecimal values and outputs result to specified result words.	299	
53	(@)DVB	BINARY DIVIDE	Divides four-digit hexadecimal dividend by four-digit hexadeci- mal divisor and outputs result to specified result words.	299	
54	(@)ADDL	DOUBLE BCD ADD	Adds two eight-digit values (2 words each) and content of CY, and outputs result to specified result words.	291	
55	(@)SUBL	DOUBLE BCD SUB- TRACT	Subtracts an eight-digit BCD value and CY from another eight- digit BCD value and outputs result to the result words.	292	
56	(@)MULL	DOUBLE BCD MULTI- PLY	Multiplies two eight-digit BCD values and outputs result to specified result words.	294	
57	(@)DIVL	DOUBLE BCD DIVIDE	Divides eight-digit BCD dividend by eight-digit BCD divisor and outputs result to specified result words.	294	
58	(@)BINL	DOUBLE BCD TO DOUBLE BINARY	Converts BCD value in two consecutive source words into binary and outputs converted data to two consecutive result words. (CQM1 only)	260	
59	(@)BCDL	DOUBLE BINARY TO DOUBLE BCD	Converts binary value in two consecutive source words into BCD and outputs converted data to two consecutive result words. (CQM1 only)	260	
60 to 69	For expansion	on instructions.		118	
70	(@)XFER	BLOCK TRANSFER	Moves content of several consecutive source words to con- secutive destination words.	239	
71	(@)BSET	BLOCK SET	Copies content of one word or constant to several consecutive words.	239	
72	(@)ROOT	SQUARE ROOT	Computes square root of eight-digit BCD value and outputs truncated four-digit integer result to specified result word. (CQM1 only)	295	
73	(@)XCHG	DATA EXCHANGE	Exchanges contents of two different words.	240	
74	(@)SLD	ONE DIGIT SHIFT LEFT	Left shifts data between starting and ending words by one digit (four bits).	233	
75	(@)SRD	ONE DIGIT SHIFT RIGHT	Right shifts data between starting and ending words by one digit (four bits).	233	
76	(@)MLPX	4-TO-16 DECODER	Converts up to four hexadecimal digits in source word into decimal values from 0 to 15 and turns ON, in result word(s), bit(s) whose position corresponds to converted value.	261	
77	(@)DMPX	16-TO-4 ENCODER	Determines position of highest ON bit in source word(s) and turns ON corresponding bit(s) in result word.	263	
78	(@)SDEC	7-SEGMENT DECODER	Converts hexadecimal values from source word to data for seven-segment display.	265	
80	(@)DIST	SINGLE WORD DIS- TRIBUTE	Moves one word of source data to destination word whose address is given by destination base word plus offset.	241	
81	(@)COLL	DATA COLLECT	Extracts data from source word and writes it to destination word.		
82	(@)MOVB	MOVE BIT	Transfers designated bit of source word or constant to desig- nated bit of destination word.		
83	(@)MOVD	MOVE DIGIT	Moves hexadecimal content of specified four-bit source digit(s) to specified destination digit(s) for up to four digits.		
84	(@)SFTR	REVERSIBLE SHIFT REGISTER	Shifts data in specified word or series of words to either left or right.	234	
85	(@)TCMP	TABLE COMPARE	Compares four-digit hexadecimal value with values in table consisting of 16 words.		

Code	Mnemonic	Name	Function		
86	(@)ASC	ASCII CONVERT	Converts hexadecimal values from the source word to eight-bit ASCII code starting at leftmost or rightmost half of starting destination word.		
87 to 89	For expansion	on instructions.		118	
91	(@)SBS	SUBROUTINE ENTRY	Calls and executes subroutine N.	321	
92	SBN	SUBROUTINE DEFINE	Marks start of subroutine N.	323	
93	RET	RETURN	Marks the end of a subroutine and returns control to main pro- gram.	323	
97	(@)IORF	I/O REFRESH	Refreshes all I/O words between the start and end words.	326	
			Cannot be used with the SRM1.		
99	(@)MCRO	MACRO	Calls and executes a subroutine replacing I/O words.	327	

Expansion Instructions

The following table shows the instructions that can be treated as expansion instructions. The default function codes are given for instructions that have codes assigned by default.

Code	Mnemonic	Name	Function	CPU Units	Page	
17	(@)ASFT	ASYNCHRONOUS SHIFT REGISTER	Creates a shift register that exchanges the con- tents of adjacent words when one of the words is zero and the other is not.	All	235	
18	ТКҮ	TEN KEY INPUT	Inputs 8 digits of BCD data from a 10-key keypad.	CQM1	356	
19	(@)MCMP	MULTI-WORD COMPARE	Compares a block of 16 consecutive words to another block of 16 consecutive words.	CQM1	253	
47	(@)RXD	RECEIVE	Receives data via a communications port.	CQM1/ SRM1	349	
48	(@)TXD	TRANSMIT	Sends data via a communications port.	CQM1/ SRM1	350	
60	CMPL	DOUBLE COMPARE	Compares two eight-digit hexadecimal values.	All	252	
61	(@)INI	MODE CONTROL	Starts and stops counter operation, compares and changes counter PVs, and stops pulse out- put.	All except SRM1	225	
62	(@)PRV	HIGH-SPEED COUNTER PV READ	Reads counter PVs and status data for the high- speed counter.	All except SRM1	227	
63	(@)CTBL	COMPARISON TABLE LOAD	Compares counter PVs and generates a direct table or starts operation.	All except SRM1	220	
64	(@)SPED	SPEED OUTPUT	Outputs pulses at the specified frequency (10 Hz to 50 KHz in 10 Hz units). The output frequency can be changed while pulses are being output.	CQM1	338	
65	(@)PULS	SET PULSES	Outputs the specified number of pulses at the specified frequency. The pulse output cannot be stopped until the specified number of pulses have been output.	CQM1	336	
66	(@)SCL	SCALE	Performs a scaling conversion on the calculated value.	CQM1	272	
67	(@)BCNT	BIT COUNTER	Counts the total number of bits that are ON in the specified block of words.	All	328	
68	(@)BCMP	BLOCK COMPARE	Judges whether the value of a word is within 16 ranges (defined by lower and upper limits).	All	250	
69	(@)STIM	INTERVAL TIMER	Controls interval timers used to perform sched- uled interrupts.	All	218	
87	DSW	DIGITAL SWITCH INPUT	Inputs 4- or 8-digit BCD data from a digital switch.	CQM1	355	
88	7SEG	7-SEGMENT DISPLAY OUTPUT	Converts 4- or 8-digit data to 7-segment display format and then outputs the converted data.	CQM1	354	
89	(@)INT	INTERRUPT CONTROL	Performs interrupt control, such as masking and unmasking the interrupt bits for I/O interrupts.	All except SRM1	334	

Code	Mnemonic	Name	Function	CPU Units	•	
	(@)ACC	ACCELERATION CON- TROL	Together with PULS(—), ACC(—) controls the acceleration and/or deceleration of pulses output from port 1 or 2.	CQM1- CPU43- EV1	342	
	(@)ADBL	DOUBLE BINARY ADD	Adds two 8-digit binary values (normal or signed data) and outputs the result to R and R+1.	CQM1	300	
	(@)APR	ARITHMETIC PROCESS	Performs sine, cosine, or linear approximation calculations.	CQM1	313	
	AVG	AVERAGE VALUE	Adds the specified number of hexadecimal words and computes the mean value. Rounds off to 4 digits past the decimal point.	CQM1	309	
	(@)COLM	LINE TO COLUMN	Copies the 16 bits from the specified word to a bit column of 16 consecutive words.	CQM1	281	
	CPS	SIGNED BINARY COM- PARE	Compares two 16-bit (4-digit) signed binary values and outputs the result to the GR, EQ, and LE flags.	CQM1	254	
	CPSL	DOUBLE SIGNED BINARY COMPARE	Compares two 32-bit (8-digit) signed binary values and outputs the result to the GR, EQ, and LE flags.	CQM1	255	
	(@)DBS	SIGNED BINARY DIVIDE	Divides one 16-bit signed binary value by another and outputs the 32-bit signed binary result to R+1 and R.	CQM1	305	
	(@)DBSL	DOUBLE SIGNED BINARY DIVIDE	Divides one 32-bit signed binary value by another and outputs the 64-bit signed binary result to R+3 to R.	CQM1	306	
	(@)FCS	FCS CALCULATE	Checks for errors in data transmitted by a Host Link command.	CQM1/ SRM1	328	
	FPD	FAILURE POINT DETECT	Finds errors within an instruction block.	CQM1	330	
	(@)HEX	ASCII-TO-HEXADECIMAL	Converts ASCII data to hexadecimal data.	CQM1/ SRM1	269	
	НКҮ	HEXADECIMAL KEY INPUT	Inputs up to 8 digits of hexadecimal data from a 16-key keypad.	CQM1	355	
	(@)HMS	SECONDS TO HOURS	Converts second data to hour and minute data.	CQM1	279	
	(@)LINE	LINE	Copies a bit column from 16 consecutive words to the specified word.	CQM1	280	
	(@)MAX	FIND MAXIMUM	Finds the maximum value in specified data area and outputs that value to another word.	CQM1	307	
	(@)MBS	SIGNED BINARY MULTI- PLY	Multiplies the signed binary content of two words and outputs the 8-digit signed binary result to R+1 and R.	CQM1	303	
	(@)MBSL	DOUBLE SIGNED BINARY MULTIPLY	Multiplies two 32-bit (8-digit) signed binary values and outputs the 16-digit signed binary result to R+3 through R.	CQM1	304	
	(@)MIN	FIND MINIMUM	Finds the minimum value in specified data area and outputs that value to another word.	CQM1	308	
	(@)NEG	2'S COMPLEMENT	Converts the four-digit hexadecimal content of the source word to its 2's complement and outputs the result to R.	CQM1	282	
	(@)NEGL	DOUBLE 2'S COMPLE- MENT	Converts the eight-digit hexadecimal content of the source words to its 2's complement and outputs the result to R and R+1.	CQM1	283	
	PID	PID CONTROL	Performs PID control based on the specified parameters.	CQM1- CPU43- EV1	347	
	(@)PLS2	PULSE OUTPUT	Accelerates pulse output from 0 to the target fre- quency at a specified rate and decelerates at the same rate.	CQM1- CPU4⊡- EV1	340	

Programming Instructions

Code	Mnemonic	Name	Function	CPU Units	Page
	(@)PWM	PULSE WITH VARIABLE DUTY RATIO	Outputs pulses with the specified duty ratio (0% to 99%) from port 1 or 2.	CQM1- CPU43- EV1	345
	(@)SBBL	DOUBLE BINARY SUB- TRACT	Subtracts an 8-digit binary value (normal or signed data) from another and outputs the result to R and R+1.	CQM1	301
	(@)SCL2	SIGNED BINARY TO BCD SCALING	Linearly converts a 4-digit signed hexadecimal value to a 4-digit BCD value.	CQM1 CPU4⊡- EV1	274
	(@)SCL3	BCD TO SIGNED BINARY SCALING	Linearly converts a 4-digit BCD value to a 4-digit signed hexadecimal value.	CQM1 CPU4⊡- EV1	276
	(@)SEC	HOURS TO SECONDS	Converts hour and minute data to second data.	CQM1	278
	(@)SRCH	DATA SEARCH	Searches the specified range of memory for the specified data. Outputs the word address(es) of words in the range that contain the data.	CQM1	346
	(@)STUP	CHANGE RS-232C SETUP	Changes the communications parameters in the PC Setup for a specified port.	SRM1	352
	(@)SUM	SUM CALCULATE	Computes the sum of the contents of the words in the specified range of memory.	CQM1	311
	(@)XFRB	TRANSFER BITS	Copies the status of up to 255 specified source bits to the specified destination bits.	CQM1	247
	ZCP	AREA RANGE COMPARE	Compares a word to a range defined by lower and upper limits and outputs the result to the GR, EQ, and LE flags.	CQM1	256
	ZCPL	DOUBLE AREA RANGE COMPARE	Compares an 8-digit value to a range defined by lower and upper limits and outputs the result to the GR, EQ, and LE flags.	CQM1	258

Appendix B

Error and Arithmetic Flag Operation

The following table shows the instructions that affect the ER, CY, GT, LT and EQ flags. In general, ER indicates that operand data is not within requirements. CY indicates arithmetic or data shift results. GT indicates that a compared value is larger than some standard, LT that it is smaller, and EQ, that it is the same. EQ also indicates a result of zero for arithmetic operations. Refer to *SECTION 5 Instruction Set* for details.

Vertical arrows in the table indicate the flags that are turned ON and OFF according to the result of the instruction.

Although ladder diagram instructions, TIM, and CNT are executed when ER is ON, other instructions with a vertical arrow under the ER column are not executed if ER is ON. All of the other flags in the following table will also not operate when ER is ON.

Instructions not shown do not affect any of the flags in the table. Although only the non-differentiated form of each instruction is shown, differentiated instructions affect flags in exactly the same way.

The ER, CY, GT, LT and EQ Flags are turned OFF when END(01) is executed, so their status cannot be monitored with a Programming Device.

The status of the ER, CY, GT, LT and EQ Flags is affected by instruction execution and will change each time an instruction that affects them is executed. Differentiated instructions are executed only once when their execution condition changes (ON to OFF or OFF to ON) and are not executed again until the next specified change in their execution condition. The status of the ER, CY, GT, LT and EQ Flags is thus affected by a differentiated instruction is not executed, i.e., when the specified change does not occur in the execution condition. When a differentiated instruction is not executed, i.e., when the specified change does not occur in the execution condition. When a differentiated instruction is not executed, the status of the ER, CY, GT, LT and EQ Flags will not change and will maintain the status produced by the last instruction that was executed.

Instructions	25503 (ER)	25504 (CY)	25505 (GR)	25506 (EQ)	25507 (LE)	25402 (N)	Page

2. Depending on the conversion results, NEG(—) and NEGL(—) may also affect the status of the underflow flag (SR 25405).

Appendix C Memory Areas

CQM1 Memory Areas

Memory Area Structure

The following memory areas can be used with the CQM1.

Da	ita area	Size	Words	Bits	Function
IR area ¹	Input area	128 or 256 bits	IR 000 to IR 015	IR 00000 to IR 01515	CQM1-CPU11/21-E: Up to 8 words (128 bits) can be used for I/O bits. Up to 7 Units can be connected.
Output area			IR 100 to IR 115	IR 10000 to IR 11515	CQM1-CPU4□-EV1: Up to 16 words (256 bits) can be used for I/O bits. Up to 11 Units can be connected.
	Work areas	2,720	IR 012 to IR 095	IR 01200 to IR 09515	Work bits do not have any specific function,
		bits min. ²	IR 112 to IR 195	IR 11200 to IR 19515	and they can be freely used within the pro- gram.
			IR 216 to IR 219	IR 21600 to IR 21915	gram.
			IR 224 to IR 229	IR 22400 to IR 22915	
MACRO operand	Input area	64 bits	IR 096 to IR 099	IR 09600 to IR 09915	Used when the MACRO instruction, MCRO(99), is used. When the MACRO
area ¹	Output area	64 bits	IR 196 to IR 199	IR 19600 to IR 19915	instruction is not used, these bits may be used as work bits.
Analog S'	V area ¹	64 bits	IR 220 to IR 223	IR 22000 to IR 22315	CQM1-CPU42-EV1: Used to store the analog set values. (Cannot be used as work bits.)
					Can be used as work bits in other CPU Units.
High-spee PV ¹	ed Counter 0	32 bits	IR 230 to IR 231	IR 23000 to IR 23115	Used to store the present values of high- speed counter 0.
Port 1 and put PVs ¹	d 2 Pulse Out-	64 bits	IR 236 to IR 239	IR 23600 to IR 23915	CQM1-CPU43-EV1: Used to store the present values of pulse outputs for ports 1 and 2. (Cannot be used as work bits.)
					CQM1-CPU44-EV1: Used by the system. (Cannot be used as work bits.)
					Can be used as work bits in other CPU Units.
High-spee and 2 PV	ed Counter 1 s ¹	64 bits	IR 232 to IR 235	IR 23200 to IR 23515	CQM1-CPU43/44-EV1: Used to store the present values of high- speed counters 1 and 2 for ports 1 and 2. (Cannot be used as work bits.)
					Can be used as work bits in other CPU Units.
Expansio	n Areas ¹	320 bits	IR 200 to IR 215 IR 240 to IR 243	IR 20000 to IR 21515 IR 24000 to IR 24315	These bits are expected to be used in planned function expansion.
SR area		184 bits	SR 244 to SR 255	SR 24400 to SR 25507	These bits serve specific functions such as flags and control bits.
					Can be used as work bits.
TR area		8 bits		TR 0 to TR 7	These bits are used to temporarily store ON/OFF status at program branches.
HR area		1,600 bits	HR 00 to HR 99	HR 0000 to HR 9915	These bits store data and retain their ON/ OFF status when power is turned off.
AR area		448 bits	AR 00 to AR 27	AR 0000 to AR 2715	These bits serve specific functions such as flags and control bits.

Da	ta area	Size	Words	Bits	Function
LR area ¹		1,024 bits	LR 00 to LR 63	LR 0000 to LR 6315	Used for 1:1 data link through the RS-232 port.
Timer/Co	unter area ³	512 bits	TC 000 to TC 511 bers)	(timer/counter num-	The same numbers are used for both timers and counters. TC 000 to TC 002 are used for interval timers.
DM area	Read/write	1,024 words	DM 0000 to DM 1023		DM area data can be accessed in word units only. Word values are retained when the power is turned off.
		5,120 words	DM 1024 to DM 6143		Available in CQM1-CPU4□-EV1 only. ⁴
	Read-only ⁵	425 words	DM 6144 to DM 6568		Cannot be overwritten from program.
	Error history area ⁵	31 words	DM 6569 to DM 6599		Used to store the time of occurrence and error code of errors that occur.
	PC Setup ⁵	56 words	DM 6600 to DM 6655		Used to store various parameters that con- trol PC operation.
User program area (UM area)		3,200 or			Used to store the program. Retained when the power is turned off.
		7,200 words			CQM1-CPU11/21-E: 3,200 words CQM1-CPU4 -EV1: 7,200 words

Note 1. IR and LR bits that are not used for their allocated functions can be used as work bits.

- 2. At least 2,720 bits can be used as work bits. The total number of bits that can be used depends on the configuration of the PC system.
- 3. When accessing a PV, TC numbers are used as word data; when accessing Completion Flags, they are used as bit data.
- 4. Although the CQM1-CPU11-E and CQM1-CPU21-E do not support DM 1024 through DM 6143, an error will not occur if they are addressed. Any attempt to write to these words will have no effect and any reads will produce all zeros.
- 5. Data in DM 6144 to DM 6655 cannot be overwritten from the program.

SR Area

These bits mainly serve as flags related to CQM1 operation. The following table provides details on the various bit functions.

Word	Bit(s)	Function	Page
SR 244	00 to 15	Input Interrupt 0 Counter Mode SV SV when input interrupt 0 is used in counter mode (4 digits hexadecimal, 0000 to FFFF). (Can be used as work bits when input interrupt 0 is not used in counter mode.)	42
SR 245	00 to 15	Input Interrupt 1 Counter Mode SV SV when input interrupt 1 is used in counter mode (4 digits hexadecimal, 0000 to FFFF). (Can be used as work bits when input interrupt 1 is not used in counter mode.)	
SR 246	00 to 15	Input Interrupt 2 Counter Mode SV SV when input interrupt 2 is used in counter mode (4 digits hexadecimal, 0000 to FFFF). (Can be used as work bits when input interrupt 2 is not used in counter mode.)	
SR 247	00 to 15	Input Interrupt 3 Counter Mode SV SV when input interrupt 3 is used in counter mode (4 digits hexadecimal, 0000 to FFFF). (Can be used as work bits when input interrupt 3 is not used in counter mode.)	
SR 248	00 to 15	Input Interrupt 0 Counter Mode PV Minus One Counter PV-1 when input interrupt 0 is used in counter mode (4 digits hexadecimal).	42
SR 249	00 to 15	Input Interrupt 1 Counter Mode PV Minus One Counter PV-1 when input interrupt 1 is used in counter mode (4 digits hexadecimal).	
SR 250	00 to 15	Input Interrupt 2 Counter Mode PV Minus One Counter PV-1 when input interrupt 2 is used in counter mode (4 digits hexadecimal).	
SR 251	00 to 15	Input Interrupt 3 Counter Mode PV Minus One Counter PV-1 when input interrupt 3 is used in counter mode (4 digits hexadecimal).	

Word	Bit(s)	Function	Page
SR 252	00	High-speed Counter 0 Reset Bit	48
	01	CQM1-CPU43-EV1: High-speed Counter 1 Reset Bit Turn ON to reset PV of high-speed counter 1 (port 1).	136
		CQM1-CPU44-EV1: Absolute High-speed Counter 1 Origin Compensation Bit Turn ON to set origin compensation for absolute high-speed counter 1 (port 1). Automat- ically turns OFF when compensation value is set in DM 6611.	
	01	CQM1-CPU43-EV1: High-speed Counter 2 Reset Bit Turn ON to reset PV of high-speed counter 2 (port 2).	136
		CQM1-CPU44-EV1: Absolute High-speed Counter 2 Origin Compensation Bit Turn ON to set origin compensation for absolute high-speed counter 2 (port 2). Automat- ically turns OFF when compensation value is set in DM 6612.	
	03 to 07	Not used.	•
	08	Peripheral Port Reset Bit Turn ON to reset peripheral port. (Not valid when peripheral device is connected.) Auto- matically turns OFF when reset is complete.	94
	09	RS-232C Port Reset Bit Turn ON to reset RS-232C port. Automatically turns OFF when reset is complete.	
	10	PC Setup Reset Bit Turn ON to initialize PC Setup (DM 6600 through DM 6655). Automatically turns OFF again when reset is complete. Only effective if the PC is in PROGRAM mode.	3
	11	Forced Status Hold Bit	17
		OFF: Bits that are forced set/reset are cleared when switching from PROGRAM mode to MONITOR mode.	
		ON: The status of bits that are forced set/reset are maintained when switching from PROGRAM mode to MONITOR mode.	
	12	I/O Hold Bit OFF:IR and LR bits are reset when starting or stopping operation. ON:IR and LR bit status is maintained when starting or stopping operation.	17
	13	Not used.	
	14	Error Log Reset Bit Turn ON to clear error log. Automatically turns OFF again when operation is complete.	441
	15	Output OFF Bit OFF: Normal output status. ON: All outputs turned OFF.	465
SR 253	00 to 07	FAL Error Code The error code (a 2-digit number) is stored here when an error occurs. The FAL number is stored here when FAL(06) or FALS(07) is executed. This word is reset (to 00) by exe- cuting a FAL 00 instruction or by clearing the error from a Peripheral Device.	209
	08	Low Battery Flag Turns ON when a CPU Unit battery voltage drops.	438
	09	Cycle Time Overrun Flag Turns ON when a cycle time overrun occurs (i.e., when the cycle time exceeds 100 ms).	438
	10 to 12	Not used.	
	13	Always ON Flag	
	14	Always OFF Flag	
	15	First Cycle Flag Turns ON for 1 cycle at the start of operation.	

Memory Areas

Appendix C

Word	Bit(s)	Function	Page
SR 254	00	1-minute clock pulse (30 seconds ON; 30 seconds OFF)	
	01	0.02-second clock pulse (0.01 second ON; 0.01 second OFF)	
	02 to 03	Not used.	
	04	CQM1-CPU4 -EV1: Overflow (OF) Flag Turns ON when the result of a calculation is above the upper limit of signed binary data.	296
	05	CQM1-CPU4—-EV1: Underflow (UF) Flag Turns ON when the result of a calculation is below the lower limit of signed binary data.	296
	06	Differential Monitor Complete Flag Turns ON when differential monitoring is complete.	136
	07	STEP(08) Execution Flag Turns ON for 1 cycle only at the start of process based on STEP(08).	210
	08	HKY(—) Execution Flag Turns ON during execution of HKY(—).	355
	09	7SEG(88) Execution Flag Turns ON during execution of 7SEG(88).	354
	10	DSW(87) Execution Flag Turns ON during execution of DSW(87).	355
	11 to 14	Not used.	•
	15	CQM1-CPU43-EV1: Pulse I/O Error Flag (FALS: 9C) Turns ON when there is an error in a pulse I/O function using port 1 or 2.	437
		CQM1-CPU44-EV1: Absolute High-speed Counter Error Flag (FALS: 9C) Turns ON when there is an error in an absolute high-speed counter using port 1 or 2.	
SR 255	00	0.1-second clock pulse (0.05 second ON; 0.05 second OFF)	
	01	0.2-second clock pulse (0.1 second ON; 0.1 second OFF)	
	02	1.0-second clock pulse (0.5 second ON; 0.5 second OFF)	
	03	Instruction Execution Error (ER) Flag Turns ON when an error occurs during execution of an instruction.	
	04	Carry (CY) Flag Turns ON when there is a carry in the results of an instruction execution.	
	05	Greater Than (GR) Flag Turns ON when the result of a comparison operation is "greater."	
	06	Equals (EQ) Flag Turns ON when the result of a comparison operation is "equal," or when the result of an instruction execution is 0.	
	07	Less Than (LE) Flag Turns ON when the result of a comparison operation is "less."	
	08 to 15	Not used.	

Note Writing is not possible for the following words: SR 248 through SR 251, and SR 253 through SR255.

Explanation of SR Bits

SR 25211 (Forced Status Hold Bit)

When the forced set/reset status is cleared, the bits that were forced will be turned ON or OFF as follows:

Forced set cleared: Bit turned ON

Forced reset cleared: Bit turned OFF

All force-set or force-reset bits will be cleared when the PC is switched to RUN mode (see note).

This bit is turned ON and OFF from a peripheral device.

A setting can be made in the PC Setup (DM 6601) to cause the status of this Bit to be retained even when powering up.

Note DM 6601 in the PC Setup can be set to maintain the previous status of the Forced Status Hold Bit when power is turned on. This setting can be used to prevent forced status from being cleared even when power is turned on.

SR 25212 (I/O Hold Bit)

This bit is turned ON and OFF from a peripheral device.

A setting can be made in the PC Setup (DM 6601) to cause the status of this Bit to be retained even when powering up.

SR 25215 (Output OFF Bit)

When this bit it turned ON, all outputs will be turned OFF and the CPU Unit's OUT INH indicator will light. Outputs will remain OFF even if output bits are turned ON by the program until this Bit is turned OFF again.

SR 25308 (Battery Low Flag) and SR 25309 (Cycle Time Overrun Flag)

A setting can be made in the PC Setup (DM 6655) so that these errors will not be generated.

AR Area

These bits mainly serve as flags related to CQM1 operation. The following table provides details on the various bit functions.

With the exception of AR 23 (Power-off Counter), the status of AR words and bits is refreshed each cycle. (AR 23 is refreshed only for power interruptions.)

Word	Bit(s)	Function	Page	
AR 00 to AR 03		Not used.		
AR 04	08 to 15	CQM1-CPU43/44-EV1: Pulse I/O or Absolute High-speed Counter Status Code: 00: Normal 01, 02: Hardware error 03: PC Setup error 04: PC stopped during pulse output	59	
AR 05	00 to 07	<th colsponse="" of="" procesing="" processing="" processing<="" td="" the=""><td>59</td></th>	<td>59</td>	59
	08	CQM1-CPU43/44-EV1: High-speed Counter 1 Comparison Flag OFF: Stopped ON: Comparing	59	
	09	CQM1-CPU43/44-EV1: High-speed Counter 1 Overflow/Underflow Flag OFF: Normal ON: Overflow or underflow occurred.	59	
	10 to 11	Not used.		
	12 to 15	CQM1-CPU43-EV1: Port 1 Pulse Output Flags12 ON:Deceleration specified. (OFF: Not specified.)13 ON:Number of pulses specified. (OFF: Not specified.)14 ON:Pulse output completed. (OFF: Not completed.)15 ON:Pulse output in progress. (OFF: No pulse output.)	341	
AR 06	00 to 15	CQM1-CPU43/44-EV1: High-speed Counter 2/Port 2 Pulse Output Flags Identical to the High-speed Counter 1/Port 1 Pulse Output Flags in AR 05.	59	
AR 07	00 to 11	Not used.		
	12	DIP Switch Pin 6 Flag OFF: CPU Unit's DIP switch pin no. 6 is OFF. ON: CPU Unit's DIP switch pin no. 6 is ON.		
	13 to 15	Not used.		

Appendix C

Word	Bit(s)	Function	Page
AR 08	00 to 03	RS-232C Communications Error Code (1-digit number) The code will be "F" when a computer running LSS/SSS is connected to the Peripheral Port.	95
	04	RS-232C Error Flag Turns ON when an RS-232C communications error occurs.	
	05	RS-232C Transmission Enabled Flag Valid only when host link, RS-232C communications are used.	
	06	RS-232C Reception Completed Flag Valid only when RS-232C communications are used.	
	07	RS-232C Reception Overflow Flag Valid only when RS-232C communications are used.)	
	08 to 11	Peripheral Device Error Code (1-digit number) The code will be "F" when a computer running LSS/SSS is connected to the Peripheral Port.	101
	12	Peripheral Device Error Flag Turns ON when a peripheral device communications error occurs.	
	13	Peripheral Device Transmission Enabled Flag Valid only when host link, RS-232C communications are used.	
	14	Peripheral Device Reception Completed Flag Valid only when RS-232C communications are used.	
	15	Peripheral Device Reception Overflow Flag Valid only when RS-232C communications are used.	
AR 09	00 to 15	RS-232C Reception Counter 4 digits BCD; valid only when RS-232C communications are used.	101
AR 10	00 to 15	Peripheral Device Reception Counter 4 digits BCD; valid only when RS-232C communications are used.	101
AR 11	00 to 07	High-speed Counter 0 Range Comparison Flags00 ON: Counter PV is within comparison range 101 ON: Counter PV is within comparison range 202 ON: Counter PV is within comparison range 303 ON: Counter PV is within comparison range 404 ON: Counter PV is within comparison range 505 ON: Counter PV is within comparison range 606 ON: Counter PV is within comparison range 707 ON: Counter PV is within comparison range 8	51
	08 to 14	Not used.	
	15	Pulse Output Status for Pulse Output Bit Specification0: Stopped; 1: Output(This bit is supported only for CPU Units produced in or after April 1995 (Lot No.: **45)).	
AR 12	00 to 15	Not used.	
AR 13	00	Memory Cassette Installed Flag Turns ON if the Memory Cassette is installed at the time of powering up.	
	01	Clock Available Flag Turns ON if a Memory Cassette equipped with a clock is installed.	
	02	Memory Cassette Write-protected Flag ON when an EEPROM Memory Cassette if mounted and write protected or when an EPROM Memory cassette is mounted.	136
	03	Not used.	
	04 to 07	Memory Cassette Code (1-digit number) 0: No Memory Cassette installed. 1: EEPROM, 4K-word Memory Cassette installed. 2: EEPROM, 8K-word Memory Cassette installed. 4: EPROM-type Memory Cassette installed.	
	08 to 15	Not used.	

Word	Bit(s)	Function	Page
AR 14	00	CPU Unit to Memory Cassette Transfer Bit Turn ON for transfer from the CPU Unit to the Memory Cassette. Automatically turns OFF again when operation is complete. (See note.)	150
	01	Memory Cassette to CPU Unit Transfer Bit Turn ON for transfer from the Memory Cassette to the CPU Unit. Automatically turns OFF again when operation is complete. (See note.)	152
	02	Memory Cassette Compare Flag ON when the contents of the PC and the Memory Cassette are being compared. Turns OFF automatically when comparison has completed. (See note.)	152
	03	Memory Cassette Comparison Results Flag ON: Difference found or comparison not possible OFF: Contents compared and found to be the same.	152
	04 to 11	Not used.	
	12	PROGRAM Mode Transfer Error Flag Turns ON when transfer could not be executed due to being in PROGRAM mode.	150
	13	Write-protect Error Flag Turns ON when transfer could not be executed due to write-protection.	437
	14	Insufficient Capacity Flag Turns ON when transfer could not be executed due to insufficient capacity at the transfer destination.	437
	15	No Program Flag Turns ON when transfer could not be executed due to there being no program in the Memory Cassette.	437
AR 15	00 to 07	Memory Cassette Program CodeCode (2-digit number) indicates the size of the program stored in the Memory Cassette.00:There is no program, or no Memory Cassette is installed.04:The program is less than 3.2K words long.08:The program is less than 7.2K words long.	
	08 to15	CPU Unit Program CodeCode (2-digit number) indicates the size of the program stored in the CPU Unit.04:The program is less than 3.2K words long.08:The program is less than 7.2K words long.	
AR 16	00 to 10	Not used.	
	11	PC Setup Initialized Flag Turns ON when a checksum error occurs in the PC Setup area and all settings are initial- ized back to the default settings.	439
	12	Program Invalid Flag Turns ON when a checksum error occurs in the UM area, or when an improper instruc- tion is executed.	439
	13	Instructions Table Initialized Flag Turns ON when a checksum error occurs in the instructions table and all settings are ini- tialized back to the default settings.	439
	14	Memory Cassette Added Flag Turns ON if the Memory Cassette is installed while the power is on.	439
	15	Memory Cassette Transfer Error Flag Turns ON if a transfer cannot be successfully executed when DIP switch pin no. 2 is set to ON (i.e., set to automatically transfer the contents of the Memory Cassette at power- up.)	439

Note With the LSS/SSS, clear the forced-set status to turn OFF these bits, which will not change even after the operation is complete. (If the Programming Console is being used, these bits will automatically turn OFF.)

Word	Bit(s)	Function	Page		
AR 17	00 to 07	"Minutes" portion of the present time, in 2 digits BCD (Valid only when a Memory Cas- sette with the clock function is installed.)	136

AR 19	00 to 07	"Hour" portion of the present time, in 2 digits BCD (Valid only when a Memory Cassette with the clock function is installed.)	-		
	08 to 15	"Date" portion of the present time, in 2 digits BCD (Valid only when a Memory Cassette with the clock function is installed.)			
AR 20	00 to 07	"Month" portion of the present time, in 2 digits BCD (Valid only when a Memory Cassette with the clock function is installed.)			
	08 to 15	"Year" portion of the present time, in 2 digits BCD (Valid only when a Memory Cassette with the clock function is installed.)			
AR 21	00 to 07	"Day of week" portion of the present time, in 2 digits BCD [00: Sunday to 06: Saturday] (Valid only when a Memory Cassette with the clock function is installed.)			
	08 to 12	Not used.			
	13	30-second Adjustment Bit Valid only when a Memory Cassette with the clock function is installed.	136		
	14	Clock Stop Bit Valid only when a Memory Cassette with the clock function is installed.			
	15	Clock Set Bit Valid only when a Memory Cassette with the clock function is installed.			
AR 22	00 to 07	Input Words Number of words for input bits (2 digits BCD)			
	08 to 15	Output Words Number of words for output bits (2 digits BCD)			
AR 23	00 to 15	Power-off Counter (4 digits BCD) This is the count of the number of times that the power has been turned off. To clear the count, write "0000" from a peripheral device.			
AR 24	00	Power-up PC Setup Error Flag Turns ON when there is an error in DM 6600 to DM 6614 (the part of the PC Setup area that is read at power-up).	3		
	01	Start-up PC Setup Error Flag Turns ON when there is an error in DM 6615 to DM 6644 (the part of the PC Setup area that is read at the beginning of operation).	439		
	02	RUN PC Setup Error Flag Turns ON when there is an error in DM 6645 to DM 6655 (the part of the PC Setup area that is always read).	3		
	03, 04	Not used.			
	05	Long Cycle Time Flag Turns ON if the actual cycle time is longer than the cycle time set in DM 6619.			
	06, 07	Not used.			
	08 to 15	Code (2 digits hexadecimal) showing the word number of a detected I/O bus error00 to 07: Correspond to input words 000 to 007.80 to 87: Correspond to output words 100 to 107.FF:End cover cannot be confirmed.			
AR 25	00 to 07	Not used.	1		
	08	FPD(—) Teaching Bit	330		
	09 to 15	Not used.			

Word	Bit(s)	Function	Page
AR 26	00 to 15	Maximum Cycle Time (4 digits BCD) The longest cycle time since the beginning of operation is stored. It is cleared at the beginning, and not at the end, of operation.	21
		The unit can be any of the following, depending on the setting of the 9F monitoring time (DM 6618). Default: 0.1 ms; "10 ms" setting: 0.1 ms; "100 ms" setting: 1 ms; "1 s" setting: 10 ms	
AR 27	00 to 15	Current Cycle Time (4 digits BCD) The most recent cycle time during operation is stored. The Current Cycle Time is not cleared when operation stops.	
		The unit can be any of the following, depending on the setting of the 9F monitoring time (DM 6618). Default: 0.1 ms; "10 ms" setting: 0.1 ms; "100 ms" setting: 1 ms; "1 s" setting: 10 ms	

CPM1/CPM1A Memory Areas

Memory Area Structure

The following memory areas can be used with the CPM1/CPM1A.

Da	ta area	Words	Bits	Function
IR area ¹	Input area	IR 000 to IR 009 (10 words)	IR 00000 to IR 00915 (160 bits)	These bits can be allocated to the external I/ O terminals.
	Output area	IR 010 to IR 019 (10 words)	IR 01000 to IR 01915 (160 bits)	
	Work area	IR 200 to IR 231 (32 words)	IR 20000 to IR 23115 (512 bits)	Work bits can be freely used within the pro- gram.
SR area		SR 232 to SR 255 (24 words)	SR 23200 to SR 25515 (384 bits)	These bits serve specific functions such as flags and control bits.
TR area			TR 0 to TR 7 (8 bits)	These bits are used to temporarily store ON/ OFF status at program branches.
HR area ²		HR 00 to HR 19 (20 words)	HR 0000 to HR 1915 (320 bits)	These bits store data and retain their ON/ OFF status when power is turned off.
AR area ²		AR 00 to AR 15 (16 words)	AR 0000 to AR 1515 (256 bits)	These bits serve specific functions such as flags and control bits.
LR area ¹		LR 00 to LR 15 (16 words)	LR 0000 to LR 1515 (256 bits)	Used for a 1:1 data link with another PC.
Timer/Cou	unter area ²	TC 000 to TC 127 (timer/counter numbers) ³		The same numbers are used for both timers and counters.
DM area	Read/write ²	DM 0000 to DM 0999 DM 1022 to DM 1023 (1,002 words)		DM area data can be accessed in word units only. Word values are retained when the power is turned off.
	Error log ²	DM 1000 to DM 1021 (22 words)		Used to store the error code of errors that occur. These words can be used as ordinary read/write DM when the error log function isn't being used.
	Read-only ⁴	DM 6144 to DM 6599 (456 words)		Cannot be overwritten from program.
	PC Setup ⁴	DM 6600 to DM 6655 (56 words)		Used to store various parameters that con- trol PC operation.

Note 1. IR and LR bits that are not used for their allocated functions can be used as work bits.

- 2. The contents of the HR area, Counter area, and read/write DM area are backed up by a capacitor. At 25°C, the capacitor will back up memory for 20 days. Refer to 2-1-2 Characteristics in the CPM1 or CPM1A Operation Manual for a graph showing the backup time vs. temperature.
- 3. When accessing a PV, TC numbers are used as word data; when accessing Completion Flags, they are used as bit data.
- 4. Data in DM 6144 to DM 6655 cannot be overwritten from the program, but they can be changed from a Peripheral Device.

5. The contents of the HR area, LR area, Counter area, and read/write DM area are backed up by a capacitor. The backup time varies with the ambient temperature, but at 25°C, the capacitor will back up memory for 20 days. If the power supply is off longer than the backup time, memory contents will be cleared and AR1314 will turn ON. (This flag turns ON when data can no longer be retained by the built-in capacitor.) Refer to 2-1-2 Characteristics in the CPM1 Operation Manual for a graph showing the backup time vs. temperature.

SR Area

These bits mainly serve as flags related to CPM1/CPM1A operation or contain present and set values for various functions. The functions of the SR area are explained in the following table.

Word(s)	Bit(s)	Function	Page
SR 232 to SR 235	00 to 15	Macro Function Input Area Contains the input operands for MCRO(99). (Can be used as work bits when MCRO(99) is not used.)	130
SR 236 to SR 239	00 to 15	Macro Function Output Area Contains the output operands for MCRO(99). (Can be used as work bits when MCRO(99) is not used.)	
SR 240	00 to 15	Input Interrupt 0 Counter Mode SV SV when input interrupt 0 is used in counter mode (4 digits hexadecimal). (Can be used as work bits when input interrupt 0 is not used in counter mode.)	42
SR 241	00 to 15	Input Interrupt 1 Counter Mode SV SV when input interrupt 1 is used in counter mode (4 digits hexadecimal). (Can be used as work bits when input interrupt 1 is not used in counter mode.)	
SR 242	00 to 15	Input Interrupt 2 Counter Mode SV SV when input interrupt 2 is used in counter mode (4 digits hexadecimal). (Can be used as work bits when input interrupt 2 is not used in counter mode.)	
SR 243	00 to 15	Input Interrupt 3 Counter Mode SV SV when input interrupt 3 is used in counter mode (4 digits hexadecimal). (Can be used as work bits when input interrupt 3 is not used in counter mode.)	
SR 244	00 to 15	Input Interrupt 0 Counter Mode PV Minus One Counter PV–1 when input interrupt 0 is used in counter mode (4 digits hexadecimal).	42
SR 245	00 to 15	Input Interrupt 1 Counter Mode PV Minus One Counter PV–1 when input interrupt 1 is used in counter mode (4 digits hexadecimal).	
SR 246	00 to 15	Input Interrupt 2 Counter Mode PV Minus One Counter PV–1 when input interrupt 2 is used in counter mode (4 digits hexadecimal).	
SR 247	00 to 15	Input Interrupt 3 Counter Mode PV Minus One Counter PV–1 when input interrupt 3 is used in counter mode (4 digits hexadecimal).	
SR 248, SR 249	00 to 15	High-speed Counter PV Area (Can be used as work bits when the high-speed counter is not used.)	48
SR 250	00 to 15	Analog Volume Setting 0 Used to store the 4-digit BCD set value (0000 to 0200) from analog volume control 0.	131
SR 251	00 to 15	Analog Volume Setting 1 Used to store the 4-digit BCD set value (0000 to 0200) from analog volume control 1.	

Appendix C

SR 254 00 1-minute clock pulse (30 seconds ON; 30 seconds OFF) SR 254 00 1-minute clock pulse (30 seconds ON; 30 seconds OFF) 02 Negative (N) Flag 03 0.02-second clock pulse (0.01 second ON; 0.01 second OFF) 10 0.02-second clock pulse (0.01 second ON; 0.01 second OFF) 10 0.02-second clock pulse (0.01 second ON; 0.01 second OFF) 10 0.05 Not used. 11 0.02-second clock pulse (0.01 second ON; 0.01 second OFF) 12 Not used. 13 0.01-second clock pulse (0.01 second ON; 0.01 second OFF) 14 0.02-second clock pulse (0.01 second ON; 0.01 second OFF) 13 0.02-second clock pulse (0.01 second ON; 0.01 second OFF) 12 Negative (N) Flag 13 0.05 Not used. 	07	Less Than (LE) Flag Turns ON when the result of a comparison operation is "less."	
	08 to 15	Not used.	

Note DM 6601 in the PC Setup can be set to maintain the previous status of the I/O Hold Bit (SR 25212) and the I/O Hold Bit (SR 25212) when power is turned off. If power is left OFF for longer than the backup time, however, status may be cleared. For details regarding the backup time, refer to the *CPM1A* or *CPM1 Operation Manual*. Refer to 1-1-3 *CPM1/CPM1A PC Setup Settings* for details on the PC Setup.

AR Area

These bits mainly serve as flags related to CPM1/CPM1A operation. These bits retain their status even after the CPM1/CPM1A power supply has been turned off or when operation begins or stops.

	01	Start-up PC Setup Error Flag Turns ON when there is an error in DM 6615 to DM 6644 (the part of the PC Setup area that is read at the beginning of operation).	
	02	RUN PC Setup Error Flag Turns ON when there is an error in DM 6645 to DM 6655 (the part of the PC Setup area that is always read).	
	03, 04	Not used.	n
	05	Long Cycle Time Flag Turns ON if the actual cycle time is longer than the cycle time set in DM 6619.	
	06, 07	Not used.	
	08	Memory Area Specification Error Flag Turns ON when a non-existent data area address is specified in the program.	
	09	Flash Memory Error Flag Turns ON when there is an error in flash memory.	
	10	Read-only DM Error Flag (See note 3.) Turns ON when a checksum error occurs in the read-only DM (DM 6144 to DM 6599) and that area is initialized.	3
	11	PC Setup Error Flag Turns ON when a checksum error occurs in the PC Setup area.	
	12	Program Error Flag Turns ON when a checksum error occurs in the program memory (UM) area, or when an improper instruction is executed.	
	13	Not used.	
	14	Data Save Error FlagTurns ON when power is turned on if data could not be saved with the built-in capacitor.Data is saved in the following areas with the built-in capacitor:DM area (Read/write-capable: DM 0000 to 0999 and DM 1022 to 1023)HR area (HR 00 to 19)Counter area (CNT 000 to 127)SR area, word 252, bits 11, 12 (when PC Setup in DM 6601 is set to maintain status)AR area, word 10 (power-off counter)Operation mode (when PC Setup in DM 6600 is set to continue mode last used before power failure)	
		If data could not be saved in the above areas: The DM, error log, HR, counter, SR (word 252, bits 11 and 12), and AR (word 10) areas will be cleared. The operation mode will go into Program Mode.	
		(For details regarding the holding time, refer to the CPM1A Operation Manual.)	
	15	Not used.	•

Word(s)	Bit(s)	Function	Page
AR 14	00 to 15	Maximum Cycle Time (4 digits BCD) (See note 1.) The longest cycle time since the beginning of operation is stored. It is cleared at the beginning, and not at the end, of operation.	21
		The units can be any of the following, depending on the setting of in DM 6618. Default: 0.1 ms; "10 ms" setting: 0.1 ms; "100 ms" setting: 1 ms; "1 s" setting: 10 ms	
AR 15	00 to 15	Current Cycle Time (4 digits BCD) (See note 1.) The most recent cycle time during operation is stored. The Current Cycle Time is not cleared when operation stops.	
		The units can be any of the following, depending on the setting of in DM 6618. Default: 0.1 ms; "10 ms" setting: 0.1 ms; "100 ms" setting: 1 ms; "1 s" setting: 10 ms	

 Note
 1. The units will be as follows, depending on the unit setting for the cycle monitor time (DM 6618): Initial status:
 0.1-ms unit

 When 10-ms unit is set:
 0.1-ms unit

 When 100-ms unit is set:
 1-ms unit

When 100-ms unit is set:	1-ms unit
When 1-s unit is set:	10-ms unit

- 2. Areas that cannot be used are cleared when the power is turned on.
- 3. The contents of AR 10 is backed up by the built-in capacitor. If power is left OFF for longer than the backup time, however, the contents may be cleared. For details regarding the backup time, refer to the *CPM1A* or *CPM1* Operation Manual.

SRM1 Memory Areas

Memory Area Structure

The following memory areas can be used with the SRM1.

Da	ta area	Words	Bits	Function
IR area ¹	Input area	IR 000 to IR 009 (10 words) IR 010 to IR 019	IR 00000 to IR 00915 (160 bits) IR 01000 to IR 01915	These bits can be allocated to the external I/ O terminals. The ON/OFF status of the I/O bits will be the same as the ON/OFF status
	Output area	(10 words)	(160 bits)	of the I/O terminals Any I/O bits not used for I/O can be used as
				work bits.
	Work area	IR 200 to IR 239 (40 words)	IR 20000 to IR 23315 (640 bits)	Work bits can be freely used within the pro- gram. IR 232 to IR 239 however, cannot be used as the the MACRO input area for the MACRO instruction.
SR area		SR 240 to SR 255 (16 words)	SR 24000 to SR 25507 (248 bits)	These bits serve as storage space for flags and function set values/present values for SRM1 operation. Refer to <i>SR Area</i> .
TR area			TR 0 to TR 7 (8 bits)	When a complicated ladder diagram cannot be recorded as a mnemonic these bits are used to temporarily store ON/OFF status at program branches. These temporary bits cannot be used within the same block but if the blocks are different several may be used. The ON/OFF status of these bits cannot be monitored using the monitoring function of a peripheral device.
HR area ²		HR 00 to HR 19 (20 words)	HR 0000 to HR 1915 (320 bits)	These bits store data and retain their ON/ OFF status when power is turned off, or operation starts or stops. They are used in the same way as work bits.
AR area ²		AR 00 to AR 15 (16 words)	AR 0000 to AR 1515 (256 bits)	These bits serve specific functions such as flags and control bits. AR 04 to 07 are used as slaves. Refer to <i>AR Area</i> .
LR area ¹		LR 00 to LR 15 (16 words)	LR 0000 to LR 1515 (256 bits)	Used for a 1:1 data link with another SRM1, CQM1 or C200HS PC.

Da	ta area	Words	Bits	Function
Timer/Co	unter area ²	TC 000 to TC 127 (time	er/counter numbers) ³	Timers and counter use the TIM, TIMH(15), CNT and CNTR(12) instructions. The same numbers are used for both timers and counters.
				Timer/counter numbers should be specified as bits when dealing with timer/counter present values. The counter data will be stored even when the SRM1 power is turned off or operation is stopped or started.
				When timer/counter are treated as up-flags the number should be specified as relay data.
DM area	Read/write ²	DM 0000 to DM 1999 (2,000 words)		DM area data can be accessed in word units only. Word values are retained when the power is turned off, or operation started or stopped.
				Read/write areas can be read and written freely within the program.
	Error log ⁴	DM 2000 to DM 2021 (22 words)		Used to store the time of occurrence and error code of errors that occur. Refer to 5-5 Coding Right-hand Instructions.
	Read-only ⁴	DM 6144 to DM 6599 (456 words)		Cannot be overwritten from program.
	PC Setup ⁴	DM 6600 to DM 6655 (56 words)		Used to store various parameters that con- trol PC operation.

Note 1. IR and LR bits that are not used for their allocated functions can be used as work bits.

- 2. The contents of the HR area, LR area, Counter area, and read/write DM area are backed up by a capacitor. At 25°C, the capacitor will back up memory for 20 days. Refer to 2-1-2 Characteristics in the SRM1 Master Control Unit Operation Manual for a graph showing the backup time vs. temperature.
- 3. When accessing a PV, TC numbers are used as word data; when accessing Completion Flags, they are used as bit data.
- 4. Data in DM 6144 to DM 6655 cannot be overwritten from the program, but they can be changed from a Peripheral Device.

SR Area

These bits mainly serve as flags related to SRM1 operation or contain present and set values for various functions. The functions of the SR area are explained in the following table.

Word(s)	Bit(s)	Function	Page
SR 240 to SR 247	00 to 15	Not used. Can be used as work bits.	
SR 248, SR 249	00 to 15	Reserved.	
SR 250, SR 251	00 to 15	Not used. Can be used as work bits.	

Word(s)	Bit(s)	Function	Page
SR 252	00	Not used. (system use)	
	01 to 07	Not used.	
	08	Peripheral Port Reset Bit Turn ON to reset peripheral port. (Not valid when peripheral device is connected.) Auto- matically turns OFF when reset is complete.	94
	09	RS-232C Port Reset Bit Automatically turns OFF when reset is complete.	
	10	PC Setup Reset Bit Turn ON to initialize PC Setup (DM 6600 through DM 6655). Automatically turns OFF again when reset is complete. Only effective if the PC is in PROGRAM mode.	3
	11	Forced Status Hold Bit	17
		OFF: The forced status of bits that are forced set/reset is cleared when switching between PROGRAM mode and MONITOR mode.	
		ON: The status of bits that are forced set/reset are maintained when switching between PROGRAM mode and MONITOR mode.	
	12	I/O Hold BitOFF: IR and LR bits are reset when starting or stopping operation.ON: IR and LR bit status is maintained when starting or stopping operation.	17
	13	Not used.	
	14	Error Log Reset Bit Turn ON to clear error log. Automatically turns OFF again when operation is complete.	442
	15	Not used.	
SR 253	00 to 07	FAL Error Code The error code (a 2-digit number) is stored here when an error occurs. The FAL number is stored here when FAL(06) or FALS(07) is executed. This word is reset (to 00) by executing a FAL 00 instruction or by clearing the error from a Peripheral Device.	209
	08	Not used.	1
	09	Cycle Time Overrun Flag Turns ON when a cycle time overrun occurs.	
	10 to 11	Not used.	
	12	RS-232C Port Set Bit Turn ON to set RS-232C port. Turn OFF when reset is complete.	
	13	Always ON Flag	
	14	Always OFF Flag	
	15	First Cycle Flag Turns ON for 1 cycle at the start of operation.	
SR 254	00	1-minute clock pulse (30 seconds ON; 30 seconds OFF)	
	01	0.02-second clock pulse (0.01 second ON; 0.01 second OFF)	
	02	Negative (N) Flag	
	03	Not used.	
	04	Overflow Flag	
	05	Underflow Flag	
l	06	Differential Monitor Complete Flag Turns ON when differential monitoring is complete.	136
	07	STEP(08) Execution Flag Turns ON for 1 cycle only at the start of process based on STEP(08).	210
	08 to 15	Not used.	

Word(s)	Bit(s)	Function	Page
SR 255	00	0.1-second clock pulse (0.05 second ON; 0.05 second OFF)	
	01	0.2-second clock pulse (0.1 second ON; 0.1 second OFF)	
	02	1.0-second clock pulse (0.5 second ON; 0.5 second OFF)	
	03	Instruction Execution Error (ER) Flag Turns ON when an error occurs during execution of an instruction.	
	04	Carry (CY) Flag Turns ON when there is a carry in the results of an instruction execution.	
	05	Greater Than (GR) Flag Turns ON when the result of a comparison operation is "greater."	
	06	Equals (EQ) Flag Turns ON when the result of a comparison operation is "equal," or when the result of an instruction execution is 0.	
	07	Less Than (LE) Flag Turns ON when the result of a comparison operation is "less."	
	08 to 15	Not used.	

AR Area

These bits mainly serve as flags related to SRM1 operation. These bits retain their status even after the SRM1 power supply has been turned off or when operation begins or stops.

	07	Turns ON when instructions other than those in the support software area used.	
	08	Memory Area Specification Error Flag Turns ON when a non-existent data area address is specified in the program.	
	09	Flash Memory Error Flag Turns ON when there is an error in flash memory.	
	10	Read-only DM Error Flag Turns ON when a checksum error occurs in the read-only DM (DM 6144 to DM 6599) and that area is initialized.	3
	11	PC Setup Error Flag Turns ON when a checksum error occurs in the PC Setup area.	
	12	Program Error Flag Turns ON when a checksum error occurs in the program memory (UM) area, or when an improper instruction is executed.	
	13	Not used. (Cleared when power is turned on.)	
AR 13	14	Data Save Error Flag Turns ON when power is turned on if data could not be saved in the following areas: DM area (read/write-capable), HR area, CNT area, SR 252, bits 11, 12 (when PC Setup 6601 is set to maintain status), error log, operation mode (when PC Setup in DM 6600 is continue mode last used before power failure).	
		(For details regarding the holding time, refer to the SRM1 Operation Manual.)	
		If data could not be saved in the above areas: The DM (read/write-capable), error log, HR, and CNT areas, and SR 252, bits 11 and 12 cleared. The operation mode will go into Program Mode.	will be
	15	SRM1 CompoBus/S Communications Error Flag	
AR 14	00 to 15	Maximum Cycle Time (4 digits BCD) The longest cycle time since the beginning of operation is stored. It is cleared at the beginning, and not at the end, of operation.	21
		The units can be any of the following, depending on the setting of in DM 6618. Default: 0.1 ms; "10 ms" setting: 0.1 ms; "100 ms" setting: 1 ms; "1 s" setting: 10 ms	
AR 15	00 to 15	Current Cycle Time (4 digits BCD) The most recent cycle time during operation is stored. The Current Cycle Time is not cleared when operation stops.	
		The units can be any of the following, depending on the setting of in DM 6618. Default: 0.1 ms; "10 ms" setting: 0.1 ms; "100 ms" setting: 1 ms; "1 s" setting: 10 ms	

Appendix D Using the Clock Function

The CQM1 can be provided with a clock function by installing a Memory Cassette equipped with a clock. This appendix explains how to use the clock.

The following two Memory Cassettes are equipped with a clock: CQM1-ME04R (EPROM) and CQM1-ME08R (EEPROM).

Data Area Words Used with the Clock

This following illustration shows the configuration of the words (AR 17 through AR 21) that are used with the clock. These words can be read and used as required. AR 17 is provided so that the hour and minute can be accessed quickly.

AR17 Hour Minute AR18 Minute Second 2 digits BCD each.		
	-	
Clock Accuracy The accuracy of the clock AR19 Date Hour (Only the last 2 digits the year are displayed)		
The accuracy of the clock depends on the ambient AR20 Year Month the year are displaye		
temperature. AR21 Day of week - 00 to 06: Sunday to S	aturday	
Ambient		
temperature Accuracy		
55°C -3 to 0 min AR2115 Clock Set Bit		
25°C ±1 min AR2114 Clock Stop Bit		
0°C -2 to 0 min AR2113 30-Second Adjustment Bit		

Setting the Time

To set the time, use a peripheral device as follows:

When Setting Everything

- 1,2,3... 1. Turn ON AR 2114 (Clock Stop Bit) to stop the clock.
 - 2. Using a peripheral device, set AR 18 through AR 20 (minute/second, date/hour, and year/ month) and AR 2100 through AR 2107 (day of week).
 - 3. Turn ON AR 2115 (Clock Set Bit) when the time set in step 2 is reached. The clock will start operating from the time that is set, and the Clock Stop Bit will turn OFF automatically. When the time setting is complete, AR 2115 will also turn OFF automatically.

When Setting Only the Seconds

It is also possible, by using AR 2113, to simply set the seconds to "00" without going through a complicated procedure. When AR 2113 is turned ON, the clock time will change as follows:

If the seconds setting is from 00 to 29, the seconds will be reset to "00" and the minute setting will remain the same.

If the seconds setting is from 30 to 59, the seconds will be reset to "00" and the minute setting will advance by one.

When the time setting is complete, AR 2113 will turn OFF automatically.

Note The time can be set easily using menu operations from a Programming Console or SSS. Refer to the CQM1 Operation Manual for the Programming Console procedure or to the SSS Operation Manual: Cseries PCs for the SSS procedure.

/!\ Caution

The clock will stop and the current date and time information will be lost if the Memory Cassette is removed from the PC.

Appendix I CPM1/CPM1A and CQM1 Memory Area Comparison

This table shows the differences between the CPM1/CPM1A and CQM1 memory areas.

Da	ta area	CPM1/CPM1A	CQM1
IR area	Input area	IR 000 to IR 009	IR 000 to IR 015
	Output area	IR 010 to IR 019	IR 100 to IR 115
	Work areas	IR 200 to IR 231	IR 016 to IR 099
	and special areas	(IR 020 to IR 199 cannot be used.)	IR 116 to IR 144
SR area		SR 232 to SR 255	SR 244 to SR 255
HR area		HR 00 to HR 19	HR 00 to HR 99
		(HR 20 to HR 99 cannot be used.)	
AR area		AR 00 to AR 15	AR 00 to AR 27
		(AR 16 to AR 27 cannot be used.)	
LR area		LR 00 to LR 15	LR 00 to LR 63
		(LR 16 to LR 63 cannot be used.)	
Timer/Cou	unter area	TC 000 to TC 127	TC 000 to TC 511
		(TC 128 to TC 511 cannot be used.)	
DM area	Read/write	DM 0000 to DM 0999	DM 0000 to DM 1023
		DM 1022 to DM 1023	DM 1024 to DM 6143
		(DM 1024 to DM 6143 cannot be used.)	
	Error history	DM 1000 to DM 1021	DM 6569 to DM 6599
	Read-only	DM 6144 to DM 6599	DM 6144 to DM 6568
	PC Setup	DM 6600 to DM 6655	DM 6600 to DM 6655

Glossary

*DM	Indirectly addressed DM area. See indirect address and DM area.
1:1 link	A link created between two PCs to create common data in their LR areas.
ACP	See add count input.
add count input	An input signal used to increment a counter when the signal changes from OFF to ON.
address	A number used to identify the location of data or programming instructions in memory.
AND	A logic operation whereby the result is true if and only if both premises are true. In ladder-diagram programming the premises are usually ON/OFF states of bits or the logical combination of such states called execution conditions.
area	See data area and memory area.
area prefix	A one or two letter prefix used to identify a memory area in the PC. All memory areas except the IR and SR areas require prefixes to identify addresses in them.
arithmetic shift	A shift operation wherein the carry flag is included in the shift.
ASCII	Short for American Standard Code for Information Interchange. ASCII is used to code characters for output to printers and other external devices.
AR Area	A PC data area allocated to flags and control bits.
AUTOEXEC.BAT	An MS DOS file containing commands automatically executed at startup.
back-up	A copy made of existing data to ensure that the data will not be lost even if the original data is corrupted or erased.
basic instruction	A fundamental instruction used in a ladder diagram. See advanced instruction.
baud rate	The data transmission speed between two devices in a system measured in bits per second.
BCD	See binary-coded decimal.
BCD calculation	An arithmetic calculation that uses numbers expressed in binary-coded decimal.
binary	A number system where all numbers are expressed in base 2, i.e., numbers are written using only 0's and 1's. Each group of four binary bits is equivalent to one hexadecimal digit. Binary data in memory is thus often expressed in hexadecimal for convenience.
binary calculation	An arithmetic calculation that uses numbers expressed in binary.
binary-coded decimal	A system used to represent numbers so that every four binary bits is numerically equivalent to one decimal digit.
bit	The smallest piece of information that can be represented on a computer. A bit has the value of either zero or one, corresponding to the electrical signals ON and OFF. A bit represents one binary digit. Some bits at particular addresses are allocated to special purposes, such as holding the status of input from external devices, while other bits are available for general use in programming.
bit address	The location in memory where a bit of data is stored. A bit address specifies the data area and word that is being addressed as well as the number of the bit with- in the word.

	Glossary
bit designator	An operand that is used to designate the bit or bits of a word to be used by an instruction.
bit number	A number that indicates the location of a bit within a word. Bit 00 is the rightmost (least-significant) bit; bit 15 is the leftmost (most-significant) bit.
bit-control instruction	An instruction that is used to control the status of an individual bit as opposed to the status of an entire word.
block	See logic block and instruction block.
building-block PC	A PC that is constructed from individual components, or "building blocks." With building-block PCs, there is no one Unit that is independently identifiable as a PC. The PC is rather a functional assembly of Units.
bus	A communications path used to pass data between any of the Units connected to it.
bus bar	The line leading down the left and sometimes right side of a ladder diagram. In- struction execution proceeds down the bus bar, which is the starting point for all instruction lines.
byte	A unit of data equivalent to 8 bits, i.e., half a word.
call	A process by which instruction execution shifts from the main program to a sub- routine. The subroutine may be called by an instruction or by an interrupt.
Carry Flag	A flag that is used with arithmetic operations to hold a carry from an addition or multiplication operation, or to indicate that the result is negative in a subtraction operation. The carry flag is also used with certain types of shift operations.
central processing unit	A device that is capable of storing programs and data, and executing the instruc- tions contained in the programs. In a PC System, the central processing unit ex- ecutes the program, processes I/O signals, communicates with external devices, etc.
СН	See word.
channel	See word.
character code	A numeric (usually binary) code used to represent an alphanumeric character.
checksum	A sum transmitted with a data pack in communications. The checksum can be recalculated from the received data to confirm that the data in the transmission has not been corrupted.
clock pulse	A pulse available at specific bits in memory for use in timing operations. Various clock pulses are available with different pulse widths, and therefore different fre- quencies.
clock pulse bit	A bit in memory that supplies a pulse that can be used to time operations. Vari- ous clock pulse bits are available with different pulse widths, and therefore dif- ferent frequencies.
common data	Data that is stored in a memory of a PC and which is shared by other PCs in the same the same system. Each PC has a specified section(s) of the area allocated to it. Each PC writes to the section(s) allocated to it and reads the sections allocated to the other PCs with which it shares the common data.
communications cable	Cable used to transfer data between components of a control system and con- forming to the RS-232C or RS-422 standards.

Glossary				
comparison instruction	An instruction used to compare data at different locations in memory to deter- mine the relationship between the data.			
Completion Flag	A flag used with a timer or counter that turns ON when the timer has timed out or the counter has reached its set value.			
condition	A symbol placed on an instruction line to indicate an instruction that controls the execution condition for the terminal instruction. Each condition is assigned a bit in memory that determines its status. The status of the bit assigned to each condition determines the next execution condition. Conditions correspond to LOAD, LOAD NOT, AND, AND NOT, OR, or OR NOT instructions.			
CONFIG.SYS	An MS DOS file containing environment settings for a personal computer.			
constant	An input for an operand in which the actual numeric value is specified. Constants can be input for certain operands in place of memory area addresses. Some operands must be input as constants.			
control bit	A bit in a memory area that is set either through the program or via a Program- ming Device to achieve a specific purpose, e.g., a Restart Bit is turned ON and OFF to restart a Unit.			
control data	An operand that specifies how an instruction is to be executed. The control data may specify the part of a word is to be used as the operand, it may specify the destination for a data transfer instructions, it may specify the size of a data table used in an instruction, etc.			
control signal	A signal sent from the PC to effect the operation of the controlled system.			
Control System	All of the hardware and software components used to control other devices. A Control System includes the PC System, the PC programs, and all I/O devices that are used to control or obtain feedback from the controlled system.			
controlled system	The devices that are being controlled by a PC System.			
count pulse	The signal counted by a counter.			
counter	A dedicated group of digits or words in memory used to count the number of times a specific process has occurred, or a location in memory accessed through a TIM/CNT bit and used to count the number of times the status of a bit or an execution condition has changed from OFF to ON.			
CPU	See central processing unit.			
CTS	An acronym for clear-to-send, a signal used in communications between elec- tronic devices to indicate that the receiver is ready to accept incoming data.			
СҮ	See Carry Flag.			
cycle	One unit of processing performed by the CPU, including ladder program execution, peripheral servicing, I/O refreshing, etc.			
cycle time	The time required to complete one cycle of CPU processing.			
cyclic interrupt	See scheduled interrupt.			
data area	An area in the PC's memory that is designed to hold a specific type of data.			
data area boundary	The highest address available within a data area. When designating an operand that requires multiple words, it is necessary to ensure that the highest address in the data area is not exceeded.			

	Glossary
data disk	A floppy disk used to same user programs, DM area contents, comments, and other user data.
data length	In communications, the number of bits that is to be treated as one unit in data transmissions.
data link	An automatic data transmission operation that allows PCs or Units within PC to pass data back and forth via common data areas.
data link area	A common data area established through a data link.
data movement instruction	An instruction used to move data from one location in memory to another. The data in the original memory location is left unchanged.
data sharing	The process in which common data areas or common data words are created between two or more PCs.
data trace	A process in which changes in the contents of specific memory locations are re- corded during program execution.
data transfer	Moving data from one memory location to another, either within the same device or between different devices connected via a communications line or network.
debug	A process by which a draft program is corrected until it operates as intended. De- bugging includes both the removal of syntax errors, as well as the fine-tuning of timing and coordination of control operations.
decimal	A number system where numbers are expressed to the base 10. In a PC all data is ultimately stored in binary form, four binary bits are often used to represent one decimal digit, via a system called binary-coded decimal.
decrement	Decreasing a numeric value, usually by 1.
default	A value automatically set by the PC when the user does not specifically set an- other value. Many devices will assume such default conditions upon the appli- cation of power.
definer	A number used as an operand for an instruction but that serves to define the in- struction itself, rather that the data on which the instruction is to operate. Defin- ers include jump numbers, subroutine numbers, etc.
destination	The location where an instruction places the data on which it is operating, as opposed to the location from which data is taken for use in the instruction. The location from which data is taken is called the source.
differentiated instruction	An instruction that is executed only once each time its execution condition goes from OFF to ON. Non-differentiated instructions are executed for each scan as long as the execution condition stays ON.
differentiation instruction	An instruction used to ensure that the operand bit is never turned ON for more than one scan after the execution condition goes either from OFF to ON for a Differentiate Up instruction or from ON to OFF for a Differentiate Down instruc- tion.
digit	A unit of storage in memory that consists of four bits.
digit designator	An operand that is used to designate the digit or digits of a word to be used by an instruction.
DIN track	A rail designed to fit into grooves on various devices to allow the devices to be quickly and easily mounted to it.

DIP switch direct output distributed control DM area	 Dual in-line package switch, an array of pins in a signal package that is mounted to a circuit board and is used to set operating parameters. A method in which program execution results are output immediately to eliminate the affects of the cycle time. A automation concept in which control of each portion of an automated system is located near the devices actually being controlled, i.e., control is decentralized and `distributed' over the system. Distributed control is a concept basic to PC Systems. A data area used to hold only word data. Words in the DM area cannot be accessed bit by bit.
distributed control	 nate the affects of the cycle time. A automation concept in which control of each portion of an automated system is located near the devices actually being controlled, i.e., control is decentralized and `distributed' over the system. Distributed control is a concept basic to PC Systems. A data area used to hold only word data. Words in the DM area cannot be ac-
	is located near the devices actually being controlled, i.e., control is decentralized and `distributed' over the system. Distributed control is a concept basic to PC Systems.A data area used to hold only word data. Words in the DM area cannot be ac-
DM area	
DM word	A word in the DM area.
downloading	The process of transferring a program or data from a higher-level or host com- puter to a lower-level or slave computer. If a Programming Device is involved, the Programming Device is considered the host computer.
EEPROM	Electrically erasable programmable read-only memory; a type of ROM in which stored data can be erased and reprogrammed. This is accomplished using a special control lead connected to the EEPROM chip and can be done without having to remove the EEPROM chip from the device in which it is mounted.
electrical noise	Random variations of one or more electrical characteristics such as voltage, cur-
EPROM	rent, and data, which might interfere with the normal operation of a device. Erasable programmable read-only memory; a type of ROM in which stored data can be erased, by ultraviolet light or other means, and reprogrammed.
error code	A numeric code generated to indicate that an error exists, and something about the nature of the error. Some error codes are generated by the system; others are defined in the program by the operator.
Error Log Area	An area used to store records indicating the time and nature of errors that have occurred in the system.
even parity	A communication setting that adjusts the number of ON bits so that it is always even. See <i>parity</i> .
event processing	Processing that is performed in response to an event, e.g., an interrupt signal.
exclusive NOR	A logic operation whereby the result is true if both of the premises are true or both of the premises are false. In ladder-diagram programming, the premises are usually the ON/OFF states of bits, or the logical combination of such states, called execution conditions.
exclusive OR	A logic operation whereby the result is true if one, and only one, of the premises is true. In ladder-diagram programming the premises are usually the ON/OFF states of bits, or the logical combination of such states, called execution condi- tions.
execution condition	The ON or OFF status under which an instruction is executed. The execution condition is determined by the logical combination of conditions on the same instruction line and up to the instruction currently being executed.
execution cycle	The cycle used to execute all processes required by the CPU, including program execution, I/O refreshing, peripheral servicing, etc.
execution time	The time required for the CPU to execute either an individual instruction or an entire program.

	Glossary
extended counter	A counter created in a program by using two or more count instructions in suc- cession. Such a counter is capable of counting higher than any of the standard counters provided by the individual instructions.
extended timer	A timer created in a program by using two or more timers in succession. Such a timer is capable of timing longer than any of the standard timers provided by the individual instructions.
FA	Factory automation.
factory computer	A general-purpose computer, usually quite similar to a business computer, that is used in automated factory control.
FAL error	An error generated from the user program by execution of an FAL(06) instruc- tion.
FALS error	An error generated from the user program by execution of an FALS(07) instruc- tion or an error generated by the system.
fatal error FCS	An error that stops PC operation and requires correction before operation can continue. See <i>frame checksum</i> .
flag	A dedicated bit in memory that is set by the system to indicate some type of op- erating status. Some flags, such as the carry flag, can also be set by the operator or via the program.
flicker bit	A bit that is programmed to turn ON and OFF at a specific frequency.
floating-point decimal	A decimal number expressed as a number (the mantissa) multiplied by a power of 10, e.g., 0.538 x 10^{-5} .
force reset	The process of forcibly turning OFF a bit via a programming device. Bits are usu- ally turned OFF as a result of program execution.
force set	The process of forcibly turning ON a bit via a programming device. Bits are usu- ally turned ON as a result of program execution.
forced status	The status of bits that have been force reset or force set.
frame checksum	The results of exclusive ORing all data within a specified calculation range. The frame checksum can be calculated on both the sending and receiving end of a data transfer to confirm that data was transmitted correctly.
function code	A two-digit number used to input an instruction into the PC.
hardware error	An error originating in the hardware structure (electronic components) of the PC, as opposed to a software error, which originates in software (i.e., programs).
header code	A code in an instruction that specifies what the instruction is to do.
hexadecimal	A number system where all numbers are expressed to the base 16. In a PC all data is ultimately stored in binary form, however, displays and inputs on Pro- gramming Devices are often expressed in hexadecimal to simplify operation. Each group of four binary bits is numerically equivalent to one hexadecimal digit.
host computer	A computer that is used to transfer data to or receive data from a PC in a Host Link system. The host computer is used for data management and overall sys- tem control. Host computers are generally small personal or business comput- ers.
host interface	An interface that allows communications with a host computer.

	Glossary	
host link	An interface connecting a PC to a host computer to enable monitoring or pro- gram control from the host computer.	
HR area	A memory area that preserves bit status during power interrupts and used as work bits in programming.	
I/O bit	A bit in memory used to hold I/O status. Input bits reflect the status of input ter- minals; output bits hold the status for output terminals.	
I/O capacity	The number of inputs and outputs that a PC is able to handle. This number rang- es from around one hundred for smaller PCs to two thousand for the largest	
I/O delay	ones. The delay in time from when a signal is sent to an output to when the status of the output is actually in effect or the delay in time from when the status of an in- put changes until the signal indicating the change in the status is received.	
I/O device	A device connected to the I/O terminals on I/O Units. I/O devices may be either part of the Control System, if they function to help control other devices, or they may be part of the controlled system.	
I/O interrupt	An interrupt generated by a signal from I/O.	
I/O point	The place at which an input signal enters the PC System, or at which an output signal leaves the PC System. In physical terms, I/O points correspond to terminals or connector pins on a Unit; in terms of programming, an I/O points correspond to I/O bits in the IR area.	
I/O refreshing	The process of updating output status sent to external devices so that it agrees with the status of output bits held in memory and of updating input bits in memory so that they agree with the status of inputs from external devices.	
I/O response time	The time required for an output signal to be sent from the PC in response to an input signal received from an external device.	
I/O Unit	The Units in a PC that are physically connected to I/O devices to input and out- put signals. I/O Units include Input Units and Output Units, each of which is avail- able in a range of specifications.	
I/O word	A word in the IR area that is allocated to a Unit in the PC System and is used to hold I/O status for that Unit.	
IBM PC/AT or compatible	A computer that has similar architecture to, that is logically compatible with, and that can run software designed for an IBM PC/AT computer.	
increment	Increasing a numeric value, usually by 1.	
indirect address	An address whose contents indicates another address. The contents of the sec- ond address will be used as the actual operand.	
initialization error	An error that occurs either in hardware or software during the PC System start- up, i.e., during initialization.	
initialize	Part of the startup process whereby some memory areas are cleared, system setup is checked, and default values are set.	
input	The signal coming from an external device into the PC. The term input is often used abstractly or collectively to refer to incoming signals.	
input bit	A bit in the IR area that is allocated to hold the status of an input.	
input device	An external device that sends signals into the PC System.	

	Glossary	
input point	The point at which an input enters the PC System. Input points correspond phys- ically to terminals or connector pins.	
input signal	A change in the status of a connection entering the PC. Generally an input signal is said to exist when, for example, a connection point goes from low to high voltage or from a nonconductive to a conductive state.	
install	The preparation necessary to use a program or software package, such as the LSS or SSS, on a computer.	
instruction	A direction given in the program that tells the PC of the action to be carried out, and the data to be used in carrying out the action. Instructions can be used to simply turn a bit ON or OFF, or they can perform much more complex actions, such as converting and/or transferring large blocks of data.	
instruction block	A group of instructions that is logically related in a ladder-diagram program. A logic block includes all of the instruction lines that interconnect with each other from one or more line connecting to the left bus bar to one or more right-hand instructions connecting to the right bus bar.	
instruction execution time	The time required to execute an instruction. The execution time for any one in- struction can vary with the execution conditions for the instruction and the oper- ands used in it.	
instruction line	A group of conditions that lie together on the same horizontal line of a ladder di- agram. Instruction lines can branch apart or join together to form instruction blocks. Also called a rung.	
interface	An interface is the conceptual boundary between systems or devices and usu- ally involves changes in the way the communicated data is represented. Inter- face devices perform operations like changing the coding, format, or speed of the data.	
interlock	A programming method used to treat a number of instructions as a group so that the entire group can be reset together when individual execution is not required. An interlocked program section is executed normally for an ON execution con- dition and partially reset for an OFF execution condition.	
interrupt (signal)	A signal that stops normal program execution and causes a subroutine to be run or other processing to take place.	
interrupt program	A program that is executed in response to an interrupt.	
inverse condition	See normally closed condition.	
JIS	An acronym for Japanese Industrial Standards.	
jump	A type of programming where execution moves directly from one point in a pro- gram to another, without sequentially executing any instructions in between.	
jump number	A definer used with a jump that defines the points from and to which a jump is to be made.	
ladder diagram (program)	A form of program arising out of relay-based control systems that uses circuit- type diagrams to represent the logic flow of programming instructions. The ap- pearance of the program is similar to a ladder, and thus the name.	
ladder diagram symbol	A symbol used in drawing a ladder-diagram program.	
ladder instruction	An instruction that represents the conditions on a ladder-diagram program. The other instructions in a ladder diagram fall along the right side of the diagram and are called terminal instructions.	

Glossary		
Ladder Support Software	A software package installed on a IBM PC/AT or compatible computer to func- tion as a Programming Device.	
least-significant (bit/word)	See rightmost (bit/word).	
LED	Acronym for light-emitting diode; a device used as for indicators or displays.	
leftmost (bit/word)	The highest numbered bits of a group of bits, generally of an entire word, or the highest numbered words of a group of words. These bits/words are often called most-significant bits/words.	
link	A hardware or software connection formed between two Units. "Link" can refer either to a part of the physical connection between two Units or a software con- nection created to data existing at another location (i.e., data links).	
load	The processes of copying data either from an external device or from a storage area to an active portion of the system such as a display buffer. Also, an output device connected to the PC is called a load.	
logic block	A group of instructions that is logically related in a ladder-diagram program and that requires logic block instructions to relate it to other instructions or logic blocks.	
logic block instruction	An instruction used to locally combine the execution condition resulting from a logic block with a current execution condition. The current execution condition could be the result of a single condition, or of another logic block. AND Load and OR Load are the two logic block instructions.	
logic instruction	Instructions used to logically combine the content of two words and output the logical results to a specified result word. The logic instructions combine all the same-numbered bits in the two words and output the result to the bit of the same number in the specified result word.	
LR area	A data area that is used in data links.	
LSS	See Ladder Support Software.	
main program	All of a program except for subroutine and interrupt programs.	
mark trace	A process in which changes in the contents of specific memory locations are re- corded during program execution.	
masked bit	A bit whose status has been temporarily made ineffective.	
masking	`Covering' an interrupt signal so that the interrupt is not effective until the mask is removed.	
megabyte	A unit of storage equal to one million bytes.	
memory area	Any of the areas in the PC used to hold data or programs.	
message number	A number assigned to a message generated with the MESSAGE instruction.	
mnemonic code	A form of a ladder-diagram program that consists of a sequential list of the in- structions without using a ladder diagram.	
MONITOR mode	A mode of PC operation in which normal program execution is possible, and which allows modification of data held in memory. Used for monitoring or debug- ging the PC.	
most-significant (bit/word)	See leftmost (bit/word).	

	Glossary	
NC input	An input that is normally closed, i.e., the input signal is considered to be present when the circuit connected to the input opens.	
negative delay	A delay set for a data trace in which recording data begins before the trace signal by a specified amount.	
nesting	Programming one loop within another loop, programming a call to a subroutine within another subroutine, or programming one jump within another.	
NO input	An input that is normally open, i.e., the input signal is considered to be present when the circuit connected to the input closes.	
noise interference	Disturbances in signals caused by electrical noise.	
nonfatal error	A hardware or software error that produces a warning but does not stop the PC from operating.	
normal condition	See normally open condition.	
normally closed condition	A condition that produces an ON execution condition when the bit assigned to it is OFF, and an OFF execution condition when the bit assigned to it is ON.	
normally open condition	A condition that produces an ON execution condition when the bit assigned to it is ON, and an OFF execution condition when the bit assigned to it is OFF.	
ΝΟΤ	A logic operation which inverts the status of the operand. For example, AND NOT indicates an AND operation with the opposite of the actual status of the operand bit.	
OFF	The status of an input or output when a signal is said not to be present. The OFF state is generally represented by a low voltage or by non-conductivity, but can be defined as the opposite of either.	
OFF delay	The delay between the time when a signal is switched OFF (e.g., by an input device or PC) and the time when the signal reaches a state readable as an OFF signal (i.e., as no signal) by a receiving party (e.g., output device or PC).	
offset	A positive or negative value added to a base value such as an address to specify a desired value.	
ON	The status of an input or output when a signal is said to be present. The ON state is generally represented by a high voltage or by conductivity, but can be defined as the opposite of either.	
ON delay	The delay between the time when an ON signal is initiated (e.g., by an input device or PC) and the time when the signal reaches a state readable as an ON signal by a receiving party (e.g., output device or PC).	
one-shot bit	A bit that is turned ON or OFF for a specified interval of time which is longer than one scan.	
one-to-one link	See 1:1 link.	
online edit	The process of changed the program directly in the PC from a Programming De- vice. Online editing is possible in PROGRAM or MONITOR mode. In MONITOR mode, the program can actually be changed while it is being	
operand	The values designated as the data to be used for an instruction. An operand can be input as a constant expressing the actual numeric value to be used or as an address to express the location in memory of the data to be used.	
operand bit	A bit designated as an operand for an instruction.	
operand word	A word designated as an operand for an instruction.	

	Glossary	
operating modes	One of three PC modes: PROGRAM mode, MONITOR mode, and RUN mode.	
operating error	An error that occurs during actual PC operation as opposed to an initialization error, which occurs before actual operations can begin.	
OR	A logic operation whereby the result is true if either of two premises is true, or if both are true. In ladder-diagram programming the premises are usually ON/OFF states of bits or the logical combination of such states called execution conditions.	
output	The signal sent from the PC to an external device. The term output is often used abstractly or collectively to refer to outgoing signals.	
output bit	A bit in the IR area that is allocated to hold the status to be sent to an output device.	
output device	An external device that receives signals from the PC System.	
output point	The point at which an output leaves the PC System. Output points correspond physically to terminals or connector pins.	
output signal	A signal being sent to an external device. Generally an output signal is said to exist when, for example, a connection point goes from low to high voltage or from a nonconductive to a conductive state.	
overflow	The state where the capacity of a data storage location has been exceeded.	
overseeing	Part of the processing performed by the CPU that includes general tasks re- quired to operate the PC.	
overwrite	Changing the content of a memory location so that the previous content is lost.	
parity	Adjustment of the number of ON bits in a word or other unit of data so that the total is always an even number or always an odd number. Parity is generally used to check the accuracy of data after being transmitted by confirming that the number of ON bits is still even or still odd.	
parity check	Checking parity to ensure that transmitted data has not been corrupted.	
PC	See Programmable Controller.	
PC configuration	The arrangement and interconnections of the Units that are put together to form a functional PC.	
PC System	With building-block PCs, all of the Units connected up to, but not including, the I/O devices. The boundaries of a PC System are the PC and the program in its CPU at the upper end; and the I/O Units at the lower end.	
РСВ	See printed circuit board.	
PC Setup	A group of operating parameters set in the PC from a Programming Device to control PC operation.	
Peripheral Device	Devices connected to a PC System to aid in system operation. Peripheral devic- es include printers, programming devices, external storage media, etc.	
peripheral servicing	Processing signals to and from peripheral devices, including refreshing, commu- nications processing, interrupts, etc.	
port	A connector on a PC or computer that serves as a connection to an external device.	

Glossary		
positive delay	A delay set for a data trace in which recording data begins after the trace signal by a specified amount.	
Power Supply Unit	A Unit that connected to a PC that provides power at the voltage required by the other Units.	
present value	The current value registered in a device at any instant during its operation. Present value is abbreviated as PV. The use of this term is generally restricted to timers and counters.	
printed circuit board	A board onto which electrical circuits are printed for mounting into a computer or electrical device.	
PROGRAM mode	A mode of operation that allows inputting and debugging of programs to be car- ried out, but that does not permit normal execution of the program.	
Programmable Controller	A computerized device that can accept inputs from external devices and gener- ate outputs to external devices according to a program held in memory. Pro- grammable Controllers are used to automate control of external devices. Although single-unit Programmable Controllers are available, building-block Programmable Controllers are constructed from separate components. Such Programmable Controllers are formed only when enough of these separate components are assembled to form a functional assembly.	
programmed alarm	An alarm given as a result of execution of an instruction designed to generate the alarm in the program, as opposed to one generated by the system.	
programmed error	An error arising as a result of the execution of an instruction designed to gener- ate the error in the program, as opposed to one generated by the system.	
programmed message	A message generated as a result of execution of an instruction designed to gen- erate the message in the program, as opposed to one generated by the system.	
Programming Console	The portable form of Programming Device for a PC.	
Programming Device	A Peripheral Device used to input a program into a PC or to alter or monitor a program already held in the PC. There are dedicated programming devices, such as Programming Consoles, and there are non-dedicated devices, such as a host computer.	
PROM	Programmable read-only memory; a type of ROM into which the program or data may be written after manufacture, by a customer, but which is fixed from that time on.	
prompt	A message or symbol that appears on a display to request input from the oper- ator.	
protocol	The parameters and procedures that are standardized to enable two devices to communicate or to enable a programmer or operator to communicate with a device.	
PV	See present value.	
RAM	Random access memory; a data storage media. RAM will not retain data when power is disconnected.	
RAS	An acronym for reliability, assurance, safety.	
read-only area	A memory area from which the user can read status but to which data cannot be written.	

	Glossary	
refresh	The process of updating output status sent to external devices so that it agrees with the status of output bits held in memory and of updating input bits in memory so that they agree with the status of inputs from external devices.	
relay-based control	The forerunner of PCs. In relay-based control, groups of relays are interconnect- ed to form control circuits. In a PC, these are replaced by programmable circuits.	
reserved bit	A bit that is not available for user application.	
reserved word	A word in memory that is reserved for a special purpose and cannot be accessed by the user.	
reset	The process of turning a bit or signal OFF or of changing the present value of a timer or counter to its set value or to zero.	
response code	A code sent with the response to a data transmission that specifies how the transmitted data was processed.	
response format	A format specifying the data required in a response to a data transmission.	
response monitoring time	The time a device will wait for a response to a data transmission before assuming that an error has occurred.	
Restart Bit	A bit used to restart part of a PC.	
result word	A word used to hold the results from the execution of an instruction.	
retrieve	The processes of copying data either from an external device or from a storage area to an active portion of the system such as a display buffer. Also, an output device connected to the PC is called a load.	
retry	The process whereby a device will re-transmit data which has resulted in an er- ror message from the receiving device.	
return	The process by which instruction execution shifts from a subroutine back to the main program (usually the point from which the subroutine was called).	
reversible counter	A counter that can be both incremented and decremented depending on the specified conditions.	
reversible shift register	A shift register that can shift data in either direction depending on the specified conditions.	
right-hand instruction	See terminal instruction.	
rightmost (bit/word)	The lowest numbered bits of a group of bits, generally of an entire word, or the lowest numbered words of a group of words. These bits/words are often called least-significant bits/words.	
rising edge	The point where a signal actually changes from an OFF to an ON status.	
ROM	Read only memory; a type of digital storage that cannot be written to. A ROM chip is manufactured with its program or data already stored in it and can never be changed. However, the program or data can be read as many times as desired.	
rotate register	A shift register in which the data moved out from one end is placed back into the shift register at the other end.	
RS-232C interface	An industry standard for serial communications.	
RUN mode	The operating mode used by the PC for normal control operations.	

	Glossary	
rung	See instruction line.	
scan	The process used to execute a ladder-diagram program. The program is exam- ined sequentially from start to finish and each instruction is executed in turn based on execution conditions.	
scan time	See cycle time.	
scheduled interrupt	An interrupt that is automatically generated by the system at a specific time or program location specified by the operator. Scheduled interrupts result in the execution of specific subroutines that can be used for instructions that must be executed repeatedly at a specified interval of time.	
SCP	See subtract count input.	
seal	See self-maintaining bit.	
self diagnosis	A process whereby the system checks its own operation and generates a warn- ing or error if an abnormality is discovered.	
self-maintaining bit	A bit that is programmed to maintain either an OFF or ON status until set or reset by specified conditions.	
series	A wiring method in which Units are wired consecutively in a string.	
servicing	The process whereby the PC checks a connector or Unit to see if special processing is required.	
set	The process of turning a bit or signal ON.	
set value	The value from which a decrementing counter starts counting down or to which an incrementing counter counts up (i.e., the maximum count), or the time from which or for which a timer starts timing. Set value is abbreviated SV.	
shift input signal	An input signal whose OFF to ON transition causes data to be shifted one bit.	
shift register	One or more words in which data is shifted a specified number of units to the right or left in bit, digit, or word units. In a rotate register, data shifted out one end is shifted back into the other end. In other shift registers, new data (either specified data, zero(s) or one(s)) is shifted into one end and the data shifted out at the other end is lost.	
signed binary	A binary value that is stored in memory along with a bit that indicates whether the value is positive or negative.	
software error	An error that originates in a software program.	
software protect	A means of protecting data from being changed that uses software as opposed to a physical switch or other hardware setting.	
source (word)	The location from which data is taken for use in an instruction, as opposed to the location to which the result of an instruction is to be written. The latter is called the destination.	
special instruction	An instruction input with a function code that handles data processing operations within ladder diagrams, as opposed to a basic instruction, which makes up the fundamental portion of a ladder diagram.	
SR area	A memory area containing flags and other bits/words with specific functions.	
SSS	See SYSMAC Support Software.	

	Glossary	
store	The process of recording a program written into a display buffer permanently in memory.	
subroutine	A group of instructions placed separate from the main program and executed only when called from the main program or activated by an interrupt.	
subroutine number	A definer used to identify the subroutine that a subroutine call or interrupt activates.	
subtract count input	An input signal used to decrement a counter when the signal changes from OFF to ON.	
SV	See set value.	
switching capacity	The maximum voltage/current that a relay can safely switch on and off.	
synchronous execution	Execution of programs and servicing operations in which program execution and servicing are synchronized so that all servicing operations are executed each time the programs are executed.	
syntax	The form of a program statement (as opposed to its meaning).	
syntax error	An error in the way in which a program is written. Syntax errors can include `spelling' mistakes (i.e., a function code that does not exist), mistakes in speci- fying operands within acceptable parameters (e.g., specifying read-only bits as a destination), and mistakes in actual application of instructions (e.g., a call to a subroutine that does not exist).	
SYSMAC Support Software	A software package installed on a IBM PC/AT or compatible computer to func- tion as a Programming Device.	
system configuration	The arrangement in which Units in a System are connected. This term refers to the conceptual arrangement and wiring together of all the devices needed to comprise the System.	
system error	An error generated by the system, as opposed to one resulting from execution of an instruction designed to generate an error.	
system error message	An error message generated by the system, as opposed to one resulting from execution of an instruction designed to generate a message.	
system setup	Operating environment settings for a Programming Device, e.g., the LSS or SSS.	
terminal instruction	An instruction placed on the right side of a ladder diagram that uses the final ex- ecution conditions of an instruction line.	
timer	A location in memory accessed through a TIM/CNT bit and used to time down from the timer's set value. Timers are turned ON and reset according to their execution conditions.	
TR area	A data area used to store execution conditions so that they can be reloaded later for use with other instructions.	
TR bit	A bit in the TR area.	
trace	An operation whereby the program is executed and the resulting data is stored to enable step-by-step analysis and debugging.	
trace memory	A memory area used to store the results of trace operations.	
transfer	The process of moving data from one location to another within the PC, or be- tween the PC and external devices. When data is transferred, generally a copy	

	Glossary	
	of the data is sent to the destination, i.e., the content of the source of the transfer is not changed.	
transmission distance	The distance that a signal can be transmitted.	
trigger	A signal used to activate some process, e.g., the execution of a trace operation.	
trigger address	An address in the program that defines the beginning point for tracing. The ac- tual beginning point can be altered from the trigger by defining either a positive or negative delay.	
UM area	The memory area used to hold the active program, i.e., the program that is being currently executed.	
Unit	In OMRON PC terminology, the word Unit is capitalized to indicate any product sold for a PC System. Most of the names of these products end with the word Unit.	
unit number	A number assigned to some Units to facilitate identification when assigning words or other operating parameters.	
unmasked bit	A bit whose status is effective. See masked bit.	
unsigned binary	A binary value that is stored in memory without any indication of whether it is positive or negative.	
uploading	The process of transferring a program or data from a lower-level or slave com- puter to a higher-level or host computer. If a Programming Devices is involved, the Programming Device is considered the host computer.	
watchdog timer	A timer within the system that ensures that the scan time stays within specified limits. When limits are reached, either warnings are given or PC operation is stopped depending on the particular limit that is reached.	
WDT	See watchdog timer.	
word	A unit of data storage in memory that consists of 16 bits. All data areas consists of words. Some data areas can be accessed only by words; others, by either words or bits.	
word address	The location in memory where a word of data is stored. A word address must specify (sometimes by default) the data area and the number of the word that is being addressed.	
work area	A part of memory containing work words/bits.	
work bit	A bit in a work word.	
work word	A word that can be used for data calculation or other manipulation in program- ming, i.e., a `work space' in memory. A large portion of the IR area is always re- served for work words. Parts of other areas not required for special purposes may also be used as work words.	
write protect switch	A switch used to write-protect the contents of a storage device, e.g., a floppy disk. If the hole on the upper left of a floppy disk is open, the information on this floppy disk cannot be altered.	
write-protect	A state in which the contents of a storage device can be read but cannot be al- tered.

Revision History

A manual revision code appears as a suffix to the catalog number on the front cover of the manual.

Cat. No. W228-E1-08

___ Revision code

The following table outlines the changes made to the manual during each revision. Page numbers refer to the previous version.

Revision code	Date	Revised	content
1	August 1993	Original production	
2	December 1993	The manual was extensively rewritten to incor Units, and Dedicated I/O Units.	rporate information related the new CPUs, I/O
2A	March 1994	Page 268: The function/setting range comme	ents for Word P1+3 have been corrected.
2B March 1995		The following instructions have been corrected INI(61); PRV(—) corrected to PRV(62); CTBI rected to SPED(64); PULS(—) corrected to F STIM(—) corrected to STIM(69); BCMP(—) of TXD(48); RXD(—) corrected to RXD(47); TK rected to DSW(87); 7SEG(—) corrected to 7: CMPL(—) corrected to CMPL(60); MCMP(— to SCL(66); BCNT(—) corrected to BCNT(67)	L(—) corrected to CTBL(63); SPED(—) cor- PULS(65); INT(—) corrected to INT(89); corrected to BCMP(68); TXD(—) corrected to Y(—) corrected to TKY(18); DSW(—) cor- SEG(88); ASFT(—) corrected to ASFT(17); -) corrected to MCMP(19); SCL(—) corrected
		 Pages 1, 2, 54, 76, 82, 86, 87, 90, 91, 92, 130, 138, 246, 247, 248, 328, 331, 345, 362, 375, 393, 400, 401: SYSMAC Support Software (SSS) added. Page 37: Third sentence in "Programming" rewritten. Page 47: The "1 kHz" corrected to "4 kHz" in the first sentence of 1–4–8 Absolute High-speed Counter Interrupts (CQM1–CPU44–E). Page 61: Areas for reading and writing reversed for the top diagram. 1–6 Calculating with Signed Binary Data added. Page 70: Top diagram corrected. Page 71: Top diagram corrected. Application example changed. Page 80, 357: IR area words and bits corrected. Page 148: Second paragraph added to Target Value Comparison. Page 148: Second paragraph added to Target Value Comparison. 	 Page 151: Paragraph added above 5–15–7 MODE CONTROL - INI(—). Page 176: Bits 12 to 16 corrected to bits 11 to 15 at the top of the page. Page 200: Top equation and example dia- gram corrected. Page 262: Second-to-last paragraph of Operand Settings corrected. Caution added. Page 268: Note added. Page 272: Diagram for the control word cor- rected. Page 281: Delimiter corrected to Terminator in the top diagram and Frame 2 corrected to Frame 3 in the bottom diagram. Page 330: First sentence corrected in 8–4 User-defined Errors. Page 336: Note corrected. Pages 343 to 345: Appendix A Standard Models deleted. Page 364: "01" corrected to "00" for AR21. Page 368: Input constants for IR 00000 to IR 00007 of DM 6620 corrected. Page 372: Note added.
2C	July 1995	The following additions/corrections were made. Page 53: Default communications settings	Page 200: "#" added to the digit designator. Bytes 61 to 66 (a to f) have been deleted from the third sentence in <i>Limitations</i> . Page 237: @AVG(—) has been deleted. Page 253: Operand data area ranges cor-
		changed and note added. Page 60: Paragraph added on link errors.	rected for IORF(97). Page 272: Caution added.
		Page 63: The following sentence was cor- rected: Examples are shown below for the Program- ming Console.	Page 353: "Programming Console" changed to "Programming Device" and paragraph added following this change. Page 373: Appendix E Battery Service Life deleted.
		Page 73: Note added on use of output point 5.	
3	December 1995	The manual was extensively revised to include the new CPM1 PCs.	
3A	April 1996	Page 296: Precautions Regarding Pulse Out Page 415: The bit allocation for the day of the	

Revision History

Revision code Date Revised content		Revised content
4	June 1997	The manual was revised to include the new CPM1A and SRM1 PCs and the V1 CQM1 CPU Units. The LSS was removed from the manual. Page 54: Note added. Page 105: CLC was added to program.
5	March 1998	The manual was revised to include the pulse output function for the CPM1A and some CPM1/CPM1A/SRM1 memory specification changes. Page xi: Information added. Page 3: Information added. Page 3: "Caution" notes deleted. Page 9: Additions to table. Pages 11, 12: Notes added. Pages 11, 20: Error log records corrected from "10" to "7." Page 16: Note added. Page 35 to 37: New section added (CPM1A pulse output function). Page 77 to 78: Information added. Page 93: Note added. Page 93: Note added. Page 104: Note added. Page 404: Note added. Page 405: Changes made to note. Page 403: Changes made to text. Page 403: Changes made to graphic; text added. Page 404: Changes made to graphic; text added. Page 429: Addition to table. Page 430: Change made to text in graphic. Page 431: Changes made to AR area memory. Page 463: Changes made to AR area memory. Page 463: Addition to table. Page 463: Addition to table.
6	December 1998	The following corrections and revisions were made. A precautions section was added before section 1. Pages 5 and 19: IR 012 to IR 015 added in DM 6626 and DM 6627. Page 49 and 78: Descriptions of target and range comparisons added. Page 317: Ranges corrected for starting and end words.
7	May 1999	The following corrections and revisions were made. Page 7: Setting for 1:1 NT Link added for DM 6645, bits 12 to 15. Page 89: Setting for 1:1 NT Link added for DM 6645 and DM 6650. Page 89, 148, and 149: Manually resetting bits from LSS/SSS added. Page 205: "A maximum of three" removed from <i>Resetting Errors</i> . Page 456: AR 1115 added. Page 457: Note added for AR 1400, AR 1401 and AR 1402. Page 469: AR 2115 corrected to AR 2113 at the bottom of the page.
08	December 2005	Pages xiv, xv, and xvii: Precautions and information on EC Directives added. Page 152: "3-6 Operation without a Battery" added. Pages 210 and 213: Notes added. Pages 270 and 272: "S must be BCD" removed from Limitations. Page 274: "S" added to "P1 + 1 must be BCD" in Limitations. Page 469: Information on clock accuracy added.
